Droughts in the Sudano-Sahelian Ecological Zone of Nigeria: Implications for Agriculture and Water Resources Development

By Dr. Abaje, I.B., Ati, O.F., Iguisi, E.O. & Jidauna, G.G.
Federal University, Dutsin-ma, Katsina State, Nigeria

Abstract - This study evaluates the extent and degree of severity of droughts in the Sudano-Sahelian Ecological Zone of Nigeria using rainfall data spanning a period of 60 years (1949-2008) for eight meteorological stations in the zone. The Normalized Rainfall Index was used in depicting periods of different drought intensities in the region. The results revealed that the zone was characterized by larger extent of severe drought since the beginning of 1968 through the early 1970s, and then the 1980s in which the drought was so severe than any other decade in the study period. The late 1990s and the 2000s on the other hand have been witnessing a decrease in the number of drought occurrences in the zone. The mean absolute probability of mild, moderate and severe droughts for the zone was 0.13 (recurrence interval of 7.7 years), 0.11 (recurrence interval of 9.1 years), and 0.08 (recurrence interval of 12.5 years) respectively.

Keywords : *drought probability, normalized rainfall index, recurrence interval, severe drought.*

Abstract - This study evaluates the extent and degree of severity of droughts in the Sudano-Sahelian Ecological Zone of Nigeria using rainfall data spanning a period of 60 years (1949-2008) for eight meteorological stations in the zone. The Normalized Rainfall Index was used in depicting periods of different drought intensities in the region. The results revealed that the zone was characterized by larger extent of severe drought since the beginning of 1968 through the early 1970s, and then the 1980s in which the drought was so severe than any other decade in the study period. The late 1990s and the 2000s on the other hand have been witnessing a decrease in the number of drought occurrences in the zone. The mean absolute probability of mild, moderate and severe droughts for the zone was 0.13 (recurrence interval of 7.7 years), 0.11 (recurrence interval of 9.1 years), and 0.08 (recurrence interval of 12.5 years) respectively. The implications for agriculture and water resources include: reduction in weight and increased deaths of livestock, food shortages, and soil depletion, the existence of few rivers and streams, and the lowering of the water table. The study recommends the adoption of better herds management practices to include: the reduction in herd numbers, strategic weaning of calves, herd segregation, and parasite control. The establishment and improvement of early warning systems, analysis of observed climatic data, the establishment of Drought and Flood Research Centers in all the universities of the zone among others were the mitigating measures recommended.

Keywords : drought probability, normalized rainfall index, recurrence interval, severe drought.

I. Introduction

Drought is one of the most important natural disasters that show its influences slowly by time. It is one of the costliest natural disaster of the world and affects more people than any other natural disaster (Loukas and Vasiliades, 2004; Bacanli *et al.,* 2008). It occurs in virtually all climatic zones, but its characteristics vary significantly from one region to another. Drought is a temporary aberration; it differs from aridity, which is restricted to low rainfall regions and is a permanent feature of climate (NDMC, 2006).

There is no universally accepted definition of drought due to the wide variety of sectors affected by drought, its diverse geographical and temporal distribution and the demand placed on water supply by human-use systems (Loukas and Vasiliades, 2004). Based on the nature of the water deficit, many authorities such as Ayoade (1988, 2004), Barry and Chorley (2003), Okorie, (2003), AMS (1997, 2004), Loukas and Vasiliades (2004), NDMC (2006), and Trenberth *et al.* (2007) amongst others inclusively defined four types of droughts: a) the meteorological drought which is defined as a lack of precipitation over region for a period of time, b) the hydrological drought which is related to a period with inadequate surface and subsurface water resources to supply established water uses of a given water resources management system, c) the agricultural drought, which, usually, refers to a period with declining soil moisture and consequent crop failure without any reference to surface water resources, d) the socio-economic drought which is associated to the failure of water resources systems to meet the water demands and thus, associating droughts with supply of and demand for an economic good (water).

One characteristic seems to be common with all the definitions: drought is caused by a deficiency in precipitation for a fairly long period of time. This may cause widespread crop failure, death of livestock, water shortages, famine and other hardships that may result in the loss of human lives.

Drought is an inherent characteristic of Africa. One-third of the people in Africa live in drought-prone areas and are vulnerable to the impacts of droughts (Bates *et al.,* 2008). Since the devastating Sahelian drought of the early 1970s, drought has reoccurred in many parts of Africa (Oladipo, 1993). In West Africa, a decline in annual rainfall has been observed since the end of the 1960s, with a decrease of 20–40% in the period 1968–1990 as compared with the 30 years between 1931 and 1960 (Nicholson *et al.*, 2000; Chappell and Agnew, 2004; Dai *et al.,* 2004).

The Sudano-Sahelian Ecological Zone (SSEZ) suffered from seasonal and inter-annual climatic variability, and there have been droughts and effective desertification processes, particularly since the 1960s (FRN, 2003). The Sahelian droughts of the 1970s and the 1980s ravaged this zone and left farmers impoverished (Ati *et al.*, 2007). It has also been noted that the frequent occurrences of drought in this zone is

Author ρ : Department of Geography, Ahmadu Bello University, Zaria, Nigeria.

responsible for the social backwardness and general poor quality of life especially among the less privileged ones (Alatise and Ikumawoyi, 2007). The situation is being aggravated by the increase in human population, which appears to be stressing the natural support system (FRN, 2005).

Since drought is an extreme weather event, appropriate techniques should therefore, be applied to determine its occurrence based on relevant data in order to ameliorate its impact on the people of Nigeria with particular reference to the SSEZ. This study, therefore, examines the extent and degree of severity of drought in the zone. It discusses the implications of the occurrence of droughts for agriculture and water resources development, and also recommends possible solutions based on the findings.

II. Study Area

The SSEZ is located in northern Nigeria between latitude 10^0N and 14^0N and longitude 4^0E and 14^0E (Fig. 1). This zone occupies almost one-third of the total land area of the country. It stretches from the Sokoto plains through the northern section of the high plains of Hausaland to the Chad Basins (Odekunle *et al.*, 2008).

The climate of the zone is the tropical wet and dry type, classified by Koppen as Aw. The zone has an average annual rainfall of about 500 mm in the extreme northeastern part to 1000 mm in the southern sub-region (Abaje *et al,* 2012a&b). The rainfall occurs between the months of April to October with a peak in August. The pattern of rainfall in the zone is highly variable in spatial and temporal dimensions with inter-annual variability of between 15 and 20%. As a result of the large inter-annual variability of rainfall, this zone is subject to frequent dry spells which can result in severe and widespread droughts (Oladipo, 1993; FRN, 2000; Okorie, 2003).

The geology, relief and geomorphological processes that shaped the landforms have greatly influenced the soils (FRN, 2000). More than half of the region is covered by ferruginous tropical soils which are heavily weathered and markedly laterized (Oladipo, 1993; FRN, 2000). They are mostly formed on granite and gneiss parent materials, and on aeolian and many sedimentary deposits (Abaje, 2007). The vegetation is the Savanna type consisting of Sudan and Sahel with the density of trees and other plants decreasing as one move northwards (Abaje, 2007). These two zones (Sudan and Sahel) are together referred to as the SSEZ. This zone has been described by many researchers as the Nigerian dry-land, containing most of the range-land of the country. It constitutes the main source of fodder and grazing land for livestock, and therefore supports large numbers of cattle and other domestic animals. Donkeys and camels are very characteristic of this zone (FRN, 2000).

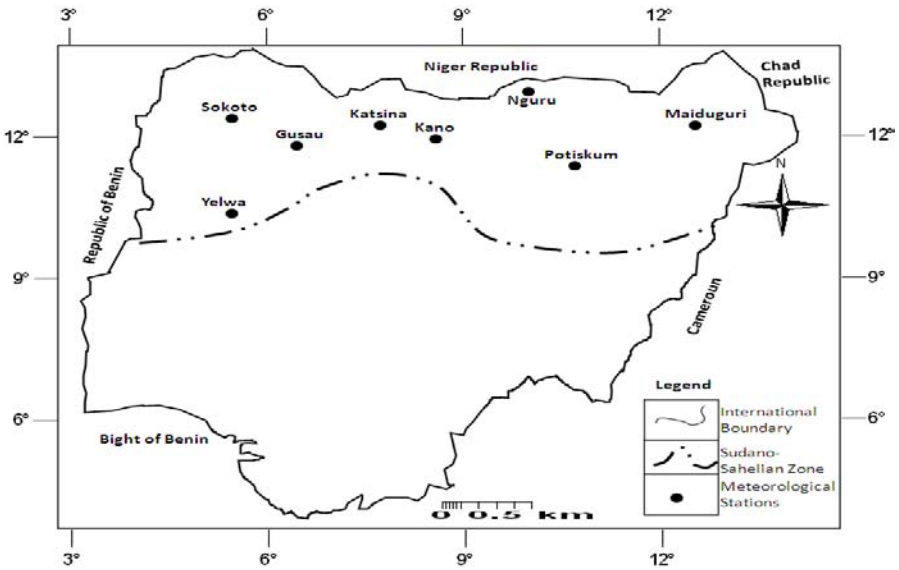

Figure 1 : The Sudano-Sahelian Ecological Zone of Nigeria (Extracted from Iloeje, 1982)

III. Materials and Methods

Rainfall data spanning a period of 60 years (1949-2008) was used in this study (Table 1). The data were sourced from the archive of Nigerian Meteorological Agency (NIMET), Oshodi-Lagos. The data were collected at eight synoptic meteorological stations in the SSEZ of Nigeria-Yelwa, Potiskum, Maiduguri, Kano, Gusau, Sokoto, Nguru, and Katsina. These stations were selected based on the following criteria: 1) they are evenly distributed, 2) all the stations have long period of recorded rainfall data that cover the period of study, 3) they have not been affected by site relocation since their establishment, and 4) the data were tested and found to be normally distributed.

Table 1 : Eight Meteorological Stations in the Sudano-Sahelian Ecological Zone

Station	Station No.	Latitude	Longitude	Altitude	Period	No. of years
Yelwa	1004.54	$10^0$53'N	$04^0$45'E	224.00m	1949-2008	60
Potiskum	1111.40	$11^0$43'N	$11^0$07'E	487.68m	1949-2008	60
Maiduguri	1113.50	$11^0$51'N	$13^0$05'E	348.00m	1949-2008	60
Kano	1208.03	$12^0$03'N	$08^0$32'E	475.80m	1949-2008	60
Gusau	1206.14	$12^0$10'N	$06^0$42'E	468.00m	1949-2008	60
Sokoto	1205.51^A	$12^0$55'N	$05^0$12'E	309.00m	1949-2008	60
Nguru	1210.52^E	$12^0$58'N	$10^0$28'E	341.00m	1949-2008	60
Katsina	1307.04	$13^0$01'N	$07^0$41'E	516.63m	1949-2008	60

Source : Nigerian Meteorological Agency (NIMET), Oshodi-Lagos.

a) Test for Normality

The standardized coefficients of Skewness (Z_1) and Kurtosis (Z_2) statistics as defined by Brazel and Balling (1986) were used to test for the normality in the seasonal (April to October) rainfall series for each of the stations. These are the months during which most of the stations in the region receive over 85% of their annual rainfall totals. The standardized coefficient of Skewness (Z_1) was calculated as:

$$Z_1 = \left[\left(\sum_{i=1}^{N}(x_i - \bar{x})^{3/N}\right) \Big/ \left(\sum_{i=1}^{N}(x_i - \bar{x})^{2/N}\right)^{3/2}\right] \Big/ \left(6/N\right)^{1/2}$$

and the standardized coefficient of Kurtosis (Z_2) was determined as:

$$Z_2 = \left[\left(\sum_{i=1}^{N}(x_i - \bar{x})^{4/N}\right) \Big/ \left(\sum_{i=1}^{N}(x_i - \bar{x})^{2/N}\right)^{2}\right] - 3 \Big/ \left(24/N\right)^{1/2}$$

Where $\bar{x}$ is the long term mean of x_i values, and N is the number of years in the sample. These statistics were used to test the null hypothesis that the individual temporal samples came from a population with a normal (Gaussian) distribution. If the absolute value of Z_1 or Z_2 is greater than 1.96, a significant deviation from the normal curve is indicated at the 95% confidence level.

b) Drought Indexing

The Normalized Rainfall Index (NRI) as defined by Türkes (1996) was used in depicting periods of different drought intensities in the region. This index uses annual or seasonal rainfall totals and the standard deviation to indicate the shortage of water of any given season. The Index for a given station is computed as:

$$A_{sy} = \frac{R_{sy} - \bar{R}_s}{S_s}$$

Where: *Rsy* = the rainfall total for the station *s* during a year (or a season)

$\bar{R}_s$ = the long-term mean (of the period specified for the station) and,

Ss= standard deviation of the annual (or seasonal) rainfall total for that station.

In this very study, a modified classification of NRI was adopted. This is because extreme values, that is, greater than or equal to 1.76 and less than or equal to -1.76 are very infrequent throughout the period of study. This modified classification is presented in Table 2.

Table 2 : Modified Classes of NRI Values

Index	Character of Rainfall
1.31 or more	Very wet
0.86 to 1.30	Moderately wet
0.51 to 0.85	Mildly wet
0.50 to -0.50	Near normal
-0.51 to -0.85	Mild drought
-0.86 to -1.30	Moderate drought
-1.31 or less	Severe drought

c) Drought Probabilities and Recurrence Intervals

The frequencies of occurrence of mild, moderate and severe droughts were then calculated and their absolute empirical probabilities were computed as the ratio of the number of actual occurrences of mild, moderate and severe drought to the number of possible occurrences. From these absolute probability values, drought recurrence intervals (or return periods) were also obtained as their inverse. This technique is computed as:

$$P = \frac{n}{Ny}$$

for absolute probability and

$$Ri = \frac{1}{P}$$

for drought recurrence intervals where:

$P =$ absolute probability of drought;

$n =$ number of occurrences of a given category of drought;

$Ny =$ total number of possible occurrence (the period specified for the station);

$Ri =$ drought recurrence intervals (or return periods).

IV. Results and Discussion

a) Test for Normality

The results of the standardized coefficients of skewness (Z_1) and kurtosis (Z_2) for the eight stations are presented in Table 3. All the stations were accepted as normal at 95% confidence level. Therefore, no transformation was made to the rainfall series.

Table 3 : Standardized Coefficients of Skewness and Kurtosis for the Eight Meteorological Stations

Statistics \ Stations	Yelwa	Potiskum	Maiduguri	Kano	Gusau	Sokoto	Nguru	Katsina
Skewness (Z_1)	0.41	0.10	0.23	0.84	0.76	0.07	0.09	-0.24
Kurtosis (Z_2)	1.80	0.52	0.59	0.48	1.07	-0.50	-0.64	-0.17

b) Occurrence of Drought

The results of analysis of Normalized Rainfall Index (NRI) in the study area are presented graphically in Figure 2 (a-h) for the 8 stations.

The results show that the zone is generally replete with severe and prolonged drought events. Mild to severe drought conditions existed over this zone in 1949. The only exception was Sokoto that experienced very wet condition while mildly wet condition existed in Yelwa.

The 1950s generally experienced normal to very wet conditions in the study area. The only exception in the zone was found at Yelwa when moderate drought affected the area in 1950 and 1952. Interestingly, the extreme northern part of the study area that was expected to be affected by drought, had a normal moisture condition throughout the decade. Nguru that is at the extreme northeastern part of the study area was the wettest in that decade.

The early 1960s featured generally normal to wet conditions, except in 1964 when moderate drought affected the northeastern part of the zone. In contrast, the other half of the 1960s was characterized by some isolated mild to severe droughts that affected different parts of the study area. About 29% of the areas were affected by moderate to severe droughts in 1966 to 1968, but this was replaced by a normal condition in 1969. The year 1968 is often referred to as the beginning of the Catastrophic Sahelian Droughts; but from the results of this analysis, only 38 % of the study area was affected by severe droughts in 1968. This implies that the Catastrophic Sahelian Droughts of 1968-1973 did not start simultaneously in the whole of the region. It started in the northern part of the West African Sahel in 1968 and retreated southwards until 1973 when the whole study area was affected by drought.

The Sahelian droughts of the 1970s were more severe and significant in the zone than those previously discussed. In 1971, mild to moderate drought affected some part of the zone. This drought continued in many areas in 1972 and was severe at Nguru. The drought hit the highest point in 1973 in which the whole study area was affected by 50% of moderate and 50% of severe drought conditions. There was a slight break in the intensity and percentage coverage of drought in 1974-1977, with only Sokoto and Potiskum area affected by severe drought in 1974 and 1977 respectively. By 1978-1979, normal conditions return to the environment.

The 1980s were characterized by more widespread, more severe and more persistent droughts than the decade 1970-1979. This decade (1980-1989) witnessed the persistent of drought in the zone beginning in 1981. It was the decade in which severe drought became more extensive. About 63% of moderate to severe droughts cover the zone in 1981-1987. The year 1987 was the driest in that decade in which about 37.5% and 62.5% of the zone was affected by moderate and severe droughts respectively. In particular, the drought of the 1987 was more severe than the driest year (1973) of the Catastrophic Sahelian Droughts of 1968-1973.

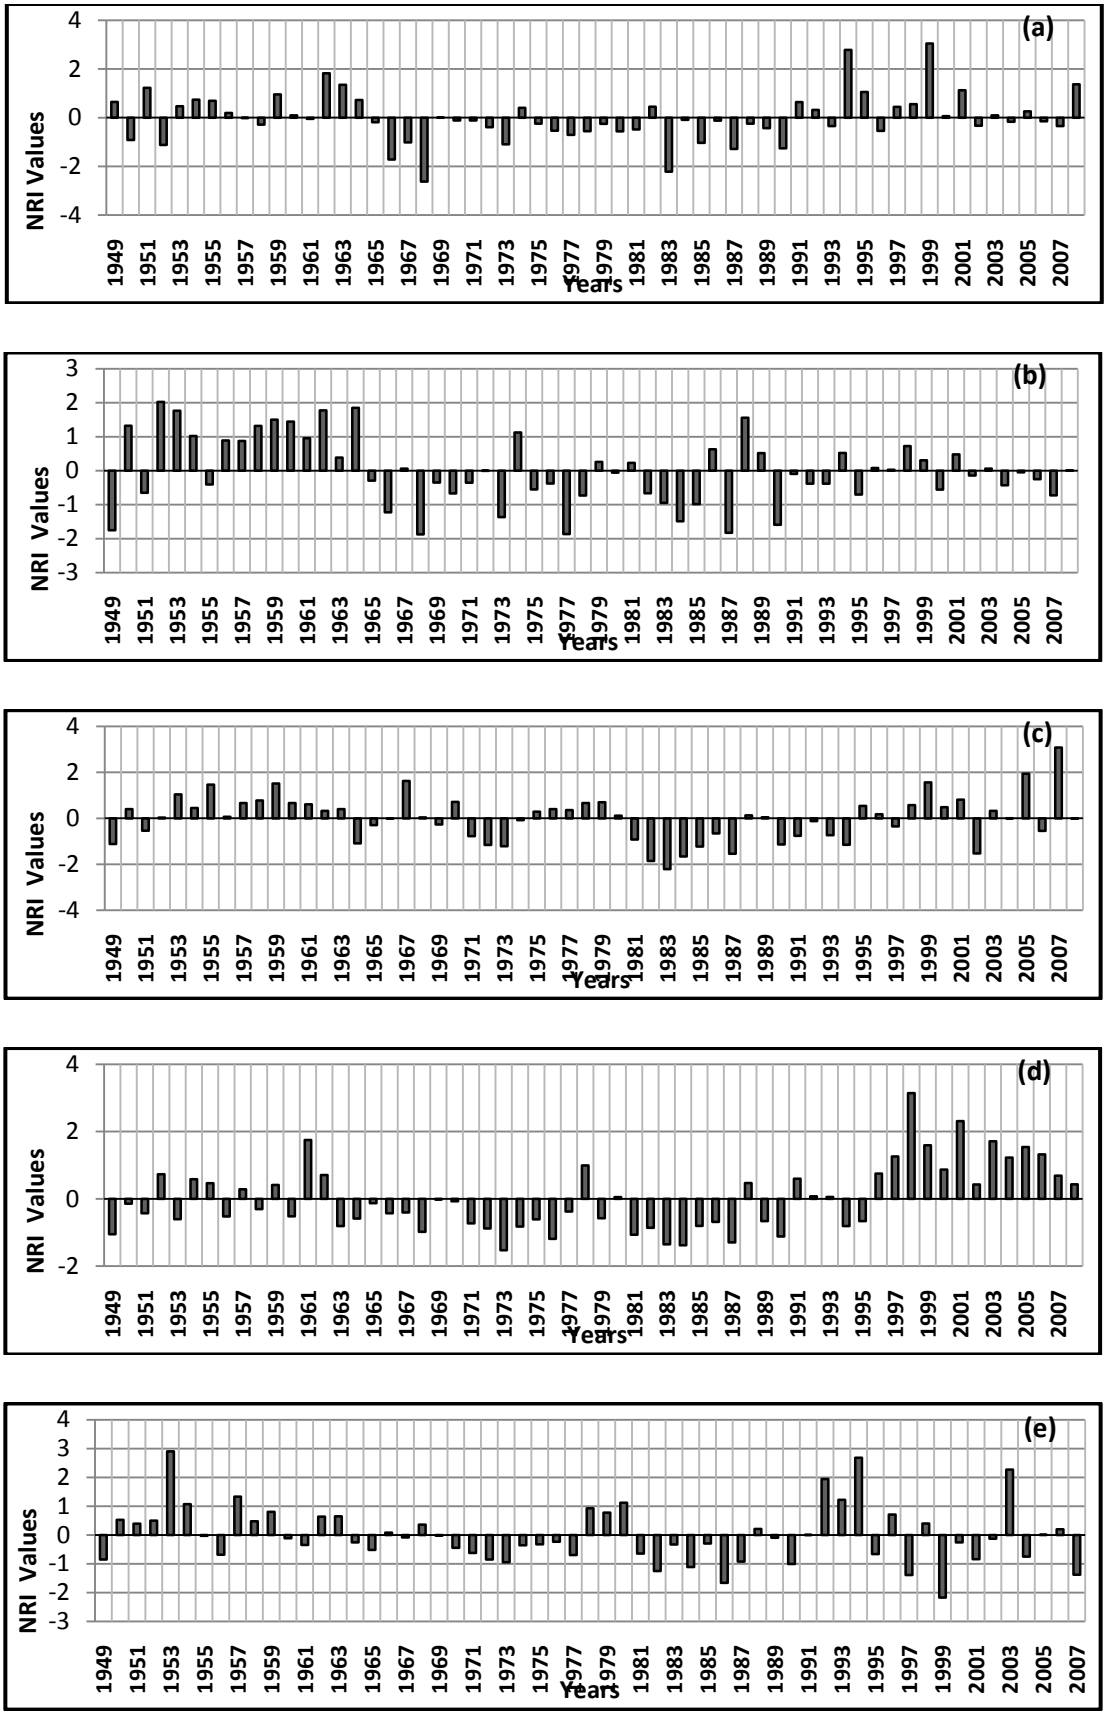

Figure 2 : Normalized Rainfall Index for (a) Yelwa; (b) Potiskum; (c) Maiduguri; (d) Kano; (e) Gusau; (f) Sokoto; (g) Nguru; and (h) Katsina

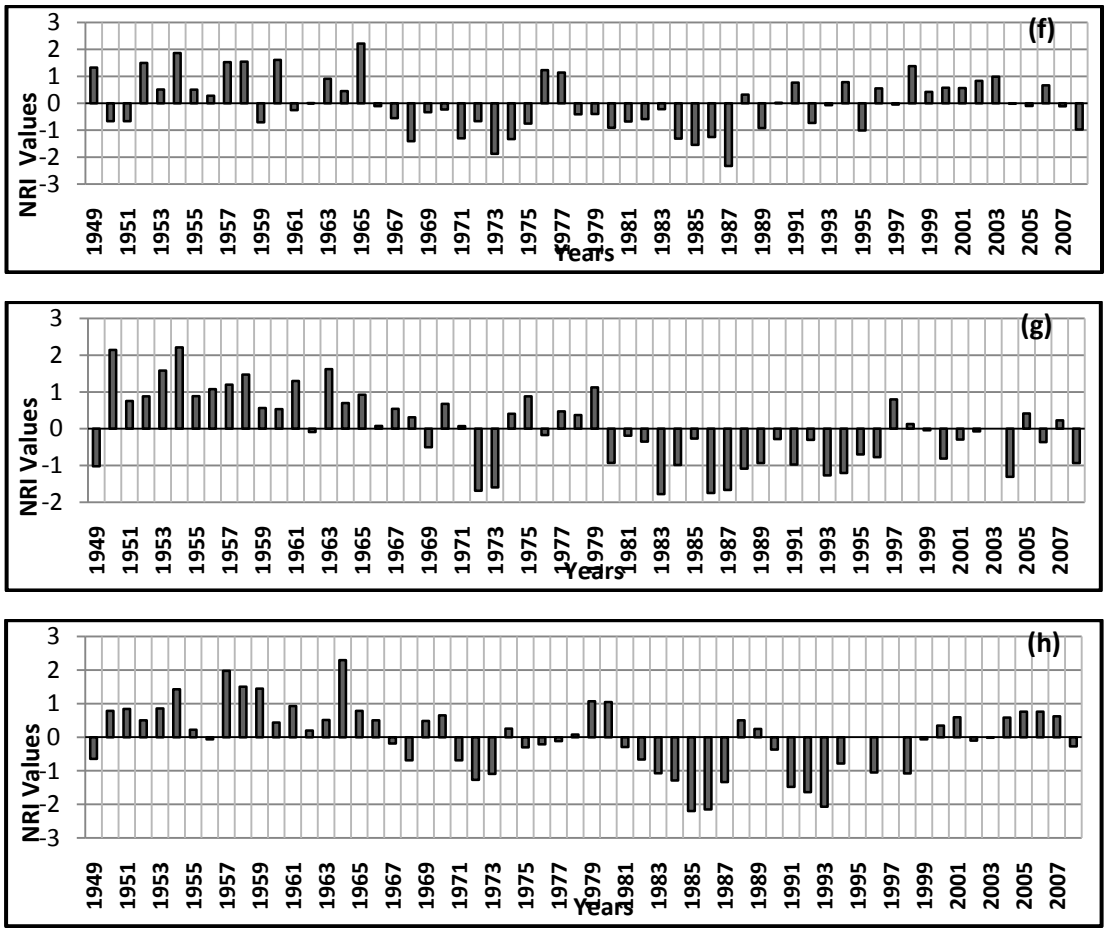

Figure 2 Continued

The first half of the 1990s featured some isolated mild to severe droughts; except 1990 in which 63% of the study area was affected by moderate to severe drought. Surprisingly, the extreme northern part of the zone had a normal moisture condition throughout that year. Contrariwise, the same extreme northern part of the zone was affected by moderate to severe drought in 1991 to 1994. Near normal to very wet conditions of about 78% dominated the other half of the 1990s.

About 85% of the study area during the period 2000-2008 generally experienced near normal to very wet conditions except some isolated mild, moderate and severe droughts that affected about 8%, 3% and 4% of the area respectively. The year 2002 was the driest in the period in which the northeastern part was affected by severe drought. After that normal condition returned in 2003 which is also the wettest year in the period.

Generally, the SSEZ of Nigeria was characterized by larger extent of severe drought since the beginning of 1968 through the early 1970s, and then the 1980s in which the drought was so severe than any other decade in the study period. The year 1987 was the driest in the whole series of drought during the study period followed by 1973 and 1983 in that order. The late 1990s and the 2000s on the other hand have been witnessing a decrease in the number of drought occurrences in the zone. The finding is in agreement with the observation made by Abaje *et al* (2012a) that the SSEZ of Nigeria has been experiencing increasing wetness over the recent years. This may be due to awareness and the general reduction in human activities that causes drought and desertification as a result of the high level of commitment from International Governmental and Non-Governmental Organization such as Intergovernmental Panel on Climate Change (IPCC), United Nations Environment Program (UNEP), and National Drought Mitigation Center (NDMC) amongst others.

c) Frequency of Drought

The absolute probabilities of occurrence of mild, moderate and severe droughts and their respective recurrence intervals were calculated for each station in the study area (Table 4). The values show variation among individual stations. Kano has the highest probability of occurrence of mild drought (0.23) than any other station in the zone with a recurrence interval (or return period) of 4.3 years, while Nguru has the least probability of occurrence of mild drought of 0.07 with a recurrence interval of 14.3 years.

The probabilities of occurrence of moderate drought for the 8 stations show that Nguru has the

highest probability of 0.15 with a return period of 6.7 years, followed by a probability of 0.13 each for Maiduguri and Kano with a recurrence interval of 7.7 years.

On the other hand, the probabilities of occurrence of severe drought for the 8 stations revealed Potiskum as having the highest probability of occurrence (0.12) with a recurrence interval of 8.3 years. Sokoto, Nguru and Katsina have a probability of 0.10 each with a recurrence interval of 10 years. The least probability of occurrence of severe drought (0.05) is found in Yelwa and Kano with a return period of 20 years.

Table 4 : Probabilities of Occurrence of Droughts and Recurrence Intervals in Years for the Sudano-Sahelian Ecological Zone of Nigeria

Stations	Mild Drought		Moderate Drought		Severe Drought	
	Probability	Recurrence Interval	Probability	Recurrence Interval	Probability	Recurrence Interval
Yelwa	0.08	12.5	0.12	8.3	0.05	20.0
Potiskum	0.13	7.7	0.05	20.0	0.12	8.3
Maiduguri	0.10	10.0	0.13	7.7	0.08	12.5
Kano	0.23	4.3	0.13	7.7	0.05	20.0
Gusau	0.17	5.9	0.08	12.5	0.07	14.3
Sokoto	0.15	6.7	0.10	10.0	0.10	10.0
Nguru	0.07	14.3	0.15	6.7	0.10	10.0
Katsina	0.08	12.5	0.10	10.0	0.10	10.0
Mean for the Zone	0.13	7.7	0.11	9.1	0.08	12.5

A closer examination of the probabilities of occurrence of severe drought in the zone shows that the extreme northern parts and northeastern parts are more susceptible to severe drought. This is in good agreement with earlier researchers that these areas are more prone to drought and desertification (Oladipo, 1993; FRN, 2000; Ayuba, 2007).

The mean absolute probability of mild drought, moderate drought and severe drought for the zone is 0.13 (recurrence interval of 7.7 years), 0.11 (recurrence interval of 9.1 years), and 0.08 (recurrence interval of 12.5 years) respectively. On the whole, the mean absolute probability of occurrence of drought in the zone is 0.11 with a recurrence interval of 9.1 years. The computed recurrence intervals are also in good agreement with the analyzed data in Fig. 2.

V. Implications for Agriculture and Water Resources Development

Water scarcity due to the occurrence of droughts affects the agricultural outputs of the zone. Food shortages result from an abnormal reduction in crop yield. Irrigation projects which would have served to mitigate these problems are also affected by water shortages as most of the dams dry up during droughts. This implies that agro-allied industries may be affected since their raw materials will be lacking. For example, lower production of cotton, tobacco and groundnuts has made the ginneries and textiles industries, tobacco, and cooking oil companies respectively to resort to importation of their raw materials. This may leads to unemployment because most of these industries/companies have to downsize their work force.

During drought periods, the land is under increased stress from both humans and livestock. This often results in the depletion of the soil. Overgrazing becomes destructive during drought when large areas that would normally have been available for grazing dry up. Animal are force to feed on any available edible vegetation they could find. This may be severe enough to cause severe damage to the environment. Once the precarious equilibrium of the plant communities adapted to the characteristically variable climate is upset by persistent drought, complete ecological recovery may be impossible, even when the rains return. Thus, drought has often been regarded as the major cause of desertification.

The occurrence of droughts in this zone has great implications on the cattle sector. The occurrence of mild drought results in cattle losing weight, whereas the occurrence of severe drought results in increased livestock mortality rates due to scarcity or lack of feed. This affects revenue generation and household income. Subsistence farmers who derive other benefits from cattle such as milking and draught power also suffer losses because the quality and quantity of the milk is reduced and also, the weight and strength of cattle for the purpose of draught power is drastically reduced.

The occurrence of droughts leads to the sustenance of few rivers and streams and the lowering of the water table. This has an implication for developmental projects that depend on water from rivers and ground water sources. The lowering of the water

table on the other hand has an implication in digging of wells and construction of bore holes because the water table may never be reached in some places; as a result, there may be scarcity of water especially in rural areas that depend solely on underground and some surface water sources.

VI. Conclusions

Drought occurs in every part of the globe and adversely affects the lives of a large number of people, causing considerable damage to economies, the environment, and property. It also affects countries or regions differently, having a greater impact on countries or regions with poor economic conditions.

Findings revealed that this zone is generally replete with severe and prolonged drought events and that the Catastrophic Sahelian Droughts of 1968-1973 did not start simultaneously in the whole of the region. It started in the northern part of the West African Sahel in 1968 and retreated southwards until 1973 when the whole study area was affected by drought. Findings further revealed that the decade (1980-1989) witnessed the persistent of drought in the zone. It was the decade in which severe drought became more extensive. In particular, the drought of the 1987 was more severe than the driest year (1973) of the Catastrophic Sahelian Droughts of 1968-1973. The late 1990s and the 2000s on the other hand have been witnessing decreasing in the number of drought occurrences in the zone.

The frequency of drought was computed, and the results revealed that the mean probability of mild, moderate, and severe droughts for the zone were 0.13 (recurrence interval of 7.7 years), 0.11 (recurrence interval of 9.1 years), and 0.08 (recurrence interval of 12.5 years) respectively.

a) Recommendations

It is a bitter reality that abnormal climatic change such as droughts in the Sudano-Sahelian zone of Nigeria cannot be averted and Man can only take measures to lessen their impacts on various disciplines. Therefore, based on the findings, the following recommendations are made:

Herd management practices are of utmost important in this zone. This is because nearly 70% of Nigerian cattle are concentrated here. The zone supports about two-thirds of the goats and sheep and almost all the donkeys, camels and horses found in the country. Herd management practices to be adopted should include the following:

- Reduction in Herd Numbers: When feed resources are getting short, one solution is to critically evaluate the members of the herd and eliminate those that are less useful. Sale or adjustment (relocating herd to non-affected pastures) are the two options available to reduce stock numbers.
- Strategic Weaning of Calves: During a drought, the production of milk rapidly depletes a cow's body reserves, while the calf derives little benefit. Weaning the calf gives the cow a better chance of survival. In drought years, early weaning is recommended. However, calves should not be weaned before 3 months of age unless absolutely necessary.
- Herd Segregation: Segregating animals into classes gives the herd a better chance of getting needed feed supplies. Segregation makes possible the preferential treatment of vulnerable classes. Pregnancy testing is a useful tool to identify heavily pregnant cows for special feeding, especially young cows that are pregnant for a second time.
- Parasite Control: Cattle under nutritional and other stresses are less resistant to parasites than in normal conditions. During drought conditions, all cattle under 18 months of age should be treated for worms.

The establishment and improvement of early warning systems for monitoring the occurrence of meteorological drought in these areas would help in planning of relief measures and will also provide input to determine agricultural drought.

The analysis of existing series of observed climatic data is of paramount important in order to develop the probability distribution of rainfall amount and timing. These distributions will provide information on the beginning, the end and the length of the rainy season and on the amount of available water during the season. Such knowledge is pertinent to the introduction of new, more productive and more drought resistant varieties of different crops and for introduction of improved farming systems. Where water retention and supplemental irrigation are possible, agricultural production can be boosted in a significant way through the use of high yielding varieties together with organic and inorganic sources of fertilization.

Construction of new wells, boreholes, and water harvesting are all mitigating measures that could be taken after the onset of drought.

Considering the importance of ground water as the major water resource for rural, urban, industry and agricultural applications in this zone, opportunities should be provided by the government for professionals to study and develop realistic methods for utilization of ground water without socio-political concerns. In such a case, it would be possible to counter drought crises by using static and dynamic storage capacities of ground water resources.

Drought and Flood Research Centers should be established in all the universities of the zone, and there should be regular organization of educational-/professional short courses on drought management for professional staff and managers and public educational programs to deal with drought problems.

Remediation of Pesticide-Polluted Water using Ozonation as a Safe Method

By Prof. Dr. Ahmed K. Salama & Khaled A Osman
Majmaah University, KSA

Abstract - The effectiveness of ozone to remove the organic compound, chloropyrifos or cypermethrin from water at the two different levels of 1 and 2 ppm, for each and different contact times was studied. The recovered amounts of chloropyrifos or cypermethrin were extracted based on the solid phase extraction (SPE) method and then analyzed by GC-MS. The results demonstrated that the removal of these organic compounds by ozone increased with increasing the contact time. The removal percentages of chloropyrifos following ozone bubbling for different periods of 15, 30, 45 and 60 minutes at room temperature were 10.5, 96.3, 97.4 and 98.5% in case of samples fortified at the level of 1 ppm, while they were 79.6, 93.9, 94.7 and 96.1% at the level of 2 ppm, respectively. In case of cypermethrin, the removal percentages were 68.6, 90.5, 97 and 99.2% at 1 ppm level, whereas they found to be 30.5, 50, 84.7 and 92% at 2 ppm, respectively. Kinetic studies revealed that chloropyrifos and cypermethrin were found to be easily removed from water by ozone treatment.

Remediation of Pesticide-Polluted Water using Ozonation as a Safe Method

Prof. Dr. Ahmed K. Salama [α] & Khaled A Osman [σ]

Abstract - The effectiveness of ozone to remove the organic compound, chloropyrifos or cypermethrin from water at the two different levels of 1 and 2 ppm, for each and different contact times was studied. The recovered amounts of chloropyrifos or cypermethrin were extracted based on the solid phase extraction (SPE) method and then analyzed by GC-MS. The results demonstrated that the removal of these organic compounds by ozone increased with increasing the contact time. The removal percentages of chloropyrifos following ozone bubbling for different periods of 15, 30, 45 and 60 minutes at room temperature were 10.5, 96.3, 97.4 and 98.5% in case of samples fortified at the level of 1 ppm, while they were 79.6, 93.9, 94.7 and 96.1% at the level of 2 ppm, respectively. In case of cypermethrin, the removal percentages were 68.6, 90.5, 97 and 99.2% at 1 ppm level, whereas they found to be 30.5, 50, 84.7 and 92% at 2 ppm, respectively. Kinetic studies revealed that chloropyrifos and cypermethrin were found to be easily removed from water by ozone treatment. This is clearly reflected in the half-live values ($t_{1/2}$), where $t_{1/2a}$ values of chlropyrifos were 15.0 and 4 minutes at the levels of 1 and 2 ppm, respectively, following ozone treatment. The $t_{1/2a}$ values of Cypermethrin at the same previous levels and treatments were found to be 8.89 and 21.71 minutes. The present results illustrated that ozone may offer an efficient, fast, safe and friendly treatment for pesticide-polluted water.

I. Introduction

The excessive use of pesticides, their volatility and long-distance transports eventually results in widespread environmental contamination. In addition more toxic and environmentally persistent pesticides are used extensively in developing nations, creating serious acute health problems and local and global environmental impacts (Ecobichon, 2001). Several pesticides were detected in groundwater (Garcia deLlasea and Bernal-Gonzales, 2001; Johnson et al, 2001; and Kadian et al 2008). The amount and type of pesticides in the water of a particular area depends largely on the intensity of production and type of crops being cultivated (Belmonte et al, 2005). Also, the rate at which a pesticide is degraded in both surface and subsurface soils is an important factor in determining the groundwater contamination potential of the pesticide (Di et al, 1998). This implies that most of the applied pesticides find their way as 'residue' in the environment into water and the terrestrial and aquatic food chains where they undergo concentration and exert potential, long term, adverse health effects (Ekstrom et al, 1996; Chirone et al, 2000; and Osman and Al-Rehiayani, 2003). Since the late decades, concern about the contamination of water sources has risen due to the increasing number of pesticides detected. Regulations for drinking water are required in order to limit human risks and environmental pollution. These regulations are well defined in North America, depending on the toxicity level of each compound, and Europe (Directive, 1998) setting at 0.1 ppm of pesticide concentration for a single pesticide compound and 0.5 ppm for the sum of all pesticides in water samples. Chlorpyrifos (O,O-diethyl O-3,5,6-trichloro-2-pyridyl phosphorothioate) is one of the most organo-phosphorus pesticides that is a widely-used for controlling various insect pests in agricultural and urban settings. Chlorpyrifos enters aquatic systems through spray drift, runoff, erosion, and spills (Racke, 1993). Cypermethrin has been widely used in both indoors and outdoors (Kaufman et al, 1981). It is especially effective towards the control of insect pests in many crops, outdoor mosquito control and as an indoor insecticide (Takahashi et al, 1985). Cypermethrin is commonly found in rivers, sediments, soils, and even foodstuffs (Allan et al, 2005 and Amweg et al, 2005). In recent times the removal of organic harmful pollutants present is investigated by means of a variety of chemical procedures. Advanced oxidation processes (AOPs) which are constituted by the combination of several oxidants, have proven to be very effective in treating a wide variety of organic contaminants. These technologies utilize powerful oxidizing intermediates (mainly OH radicals) to oxidize organic pollutants, leading not only to their destruction, but also, given sufficient conditions, to their complete mineralization. The OH radicals can be generated, for example, by the application of ozone/hydrogen peroxide, ultraviolet radiation/ozone, ultraviolet radiation/hydrogen peroxide, ozone/electron beam (Gehringer et al, 1992; Legrini et al, 1993 and Acero et al 2001). Ozone is a triatomic form of oxygen and is referred to as activated oxygen, allotropic oxygen or pure air. It is an unstable gas and the half-life ozone in distilled water at 20 ^{0}C is about 20-30 min and degrades in pure water rather quickly to

Author α : Head of Medical Laboratories Dept. Majmaah University, KSA.
Author σ : Plant Protection Department & Production, Faculty of Agriculture & Veterinary Medicine, Qassim University, Bureidah, Saudi Arabia. E-mail : aksalamah@yahoo.com

oxygen, and even more rapidly in impure solution (Hill and Rice 1982), while It has a long half-life in the gaseous state (Rice, 1986). Ozone has been approved for use as a disinfectant or sanitizer in foods and food processing in the United States for removing residual pollutants such as pesticides and other pollutants which are difficult to get rid of in biological oxidation processes due to its high oxidability, high reaction rate and absence of any secondary pollution. It is considered as a powerful oxidant having electrochemical oxidation potential of 2.0V versus 2.8V for hydroxyl radical. Consequently, oxidation by ozone have usually been used as an effective method for removing residual pollutants such as pesticides and other hazardous chemicals from raw water used for drinking and for wastewater treatment (Lafi and Al-Qodah, 2006). There is no data about the removal of chropyrifos or cypermethrin from water in KSA and the search for means to improve the production of clean water in KSA is always the target of scientists, politicians and businessmen, who seek new techniques to enhance the quality and safety of this product. A wide range of water and terrestrial ecosystems might be contaminated with chlorpyrifos and cypermethrin (EPA, 1997 and Sapozhnikova et al, 2004) which have increased the public concern to establish an efficient, safe, and cost effective method to remove or detoxify chlorpyrifos and cypermethrin residues in contaminated water. Therefore, the present study was carried out to evaluate the effectiveness of ozone at different contact times as a safe method for removal of chropyrifos and cypermethrin in water samples.

II. Materials and Methods

a) Chemicals

Technical grade standard of chlropyrifos (O,O-diethyl O-(3,5,6-trichloro-2-pyridinyl) phosphorothioate) was obtained from Chemservice, USA, with purity of 99% purity, while cypermethrin (cyano(3-phenoxyphenyl)methyl 3-(2,2-dichloroethenyl)-2,2-dimethyl cyclopropanecarboxylate) was purchased from Agrochemicals, Egypt, with purity of 91.5%. Certified HPLC-grade of actone, methanol, cyclohexane and ethyl acetate were purchased from BDH Company, while the Water spe-20G Column Processor designed vacuum manifold capable of processing up to 20 solid phase extraction (SPE) columns and SPE columns (Waters spe™, C18, 500 mg per column) were purchased from Waters, USA. Ultra-pure deionized water of 15 MΩ cm resistivity was obtained from a water purification system (PURELAB Option-R, ELGA, UK) and used throughout this study. All other chemicals used in this study were of the highest grade available.

b) Experimental Procedure

i. *Removal of organic compounds residues from groundwater*

Groundwater samples were collected from different locations at Al-Qassim region. Water samples were fortified with the organic compounds, chlropyrifos and cypermethrin at two levels for each compound (1 and 2 ppm). Removal of organic compounds from water samples was studied at four different contact times to ozone gas (15, 30, 45 and 60 min) at room temperature (25 ± 1^0C). Triplicate random water samples (4 L each) were treated with ozone at the previous mentioned periods. Ozone gas (100 ppm at air flow rate of 2.5 L/min with ozone output of 300 mg/hr) produced by Xetin Ozone Air &Water purifier (Model XT 301, Xetin Co. Ltd, Taiwan) was bubbled into 10 liters deionized water in polypropylene cylinder. The duration of dissolved ozone levels were controlled via adjusting the duration of bubbling. A 500 ml volume of water was withdrawn after different time on intervals and kept at 4^0C until analysis.

ii. *Extraction Procedure*

Water samples were extracted according to the procedure of Quintana et al (2001). with slight modification. In brief, A 500 ml volume of water, in which 5 ml of methanol had been added, was passed over the conditioned sorbent (3 ml of ethyl acetate, 3 ml of methanol and 6 ml of water, the sorbent of SPE was never allowed to dry during the conditioning and sample loading steps.) at a flow-rate of 5 ml/min. The sorbent was afterwards dried under vacuum for 20 min. Elution was performed by soaking the cartridge with 2.5 ml of ethyl acetate at a flow-rate of 0.8 ml/min, eluted with a second portion of 2.5 ml of ethyl acetate and collected in a glass vessel containing 0.5 ml of isooctane. The elute was then dried under vacuum to 0.45 ml. The volume was precisely readjusted to 0.5 ml of isooctane and then analyzed by gas chromatography-mass spectroscopy (GC-MS).

iii. *Recovery Experiments*

Pure water samples were spiked with either chlropyrifos or cypermethrin standard solutions in acetone to give the four levels of 0.25, 0.50, 1 and 2 ppm prior to extraction. They were then prepared according to the proposed procedure as described previously and then absolute recoveries were measured. The recovery values were found to be ranged from 98-104 and 92-106% for chlropyrifos and cypermethrin, respectively.

iv. *Determination of detection and quantitation limits*

The limits of detection (LOD) and limit of quantitation (LOQ) were calculated from the signal-to-noise ratios obtained by analyzing unspiked samples (n = 10); LOD and LOQ were taken to be the concentrations of pesticide resulting in a signal-to-noise ratio of 3 and 10, respectively. The LOD values were

1.90 and 0.2 ppb, while and LOQ values were 6.30 and 0.67 ppb for chlropyrifos and cypermethrin, respectively.

v. *Gaschromatography-mass spectrometry (GC-MS)*

Gas chromatography (Model GC 450, Varian Inc., The Netherlands) with a mass spectrometry (MS 220.41) detector equipped with split/splitless injector with electronic pressure control was employed. A Fused silica CP-Sil 8 CB-LB/MS capillary column (30 m x 0.25 mm i.d) was used in combination with the following oven temperature programme for chlropyrifos: initial temperature 50 °C, 5 °C/min ramp to 160 °C held for 10 min (first step) and from 160 to 250 °C (20 min) at 15 °C (final step) and 90 °C, 5 °C/min ramp to 160 °C held for 10 min (first step) and from 160 to 250 °C (20 min) at 15 °C (final step) for cypermethrin. The injector temperature was 280 °C and mass range from 50-650 amu. The carrier gas (helium, 99.999%) flow rate was set to a constant head pressure of 200 kPa at flow rate of 1.0 ml min-1 with split ratio of 1: 20 min. The mass spectrometer was operated in electron ionization mode with a transfer line temperature of 280 °C, manifold temperature 40 °C, ion trap temperature 200 °C, ion source 240 °C and selected ion monitoring (SIM) mode. The ion energy for electron impact (EI) was kept at 70 eV. MS Workstation version 6.9.1. was used for data acquisition. For positive identification, both retention time (Rt) and the presence of five fragment ions (z/m ions: 197, 97, 199, 29 and 414 for chlropyrifos and 163, 165, 181, 91 and 77 for cypermethrin) were considered. Figures 1 and 2 represent the GC-MS chromatgrams for chlropyrifos and cypermethrin, respectively.

III. Results and Discussion

The study shows one of the analytical methods that use a solid phase extraction (SPE) to pre-treat the sample and further analysis of the extract by gas chromatograph- mass spectrometer(GC-MS) equipped with electron impact ionization (EI) detector. SPE is particularly suited for the isolation of organic micro-pollutants from water and has now become the method of choice in order to carry out simultaneously the extraction and concentration of many pesticides and metabolites in aqueous samples (Heberer et al, 1994; Font, 1993 and Sabik et al, 2000). The most widely used sorbents are C8 and C18 chemically bonded to silica, carbon black and polymeric resins (Sabik et al, 2000).

a) Removing of chlropyrifos and cypermethrin by ozone treatment

The effect of ozone treatment on either chlropyrifos or cypermethrin residues for different contact times was investigated. The amount of either chlropyrifos or cypermethrin levels was significantly decreased exponentially as the contact time increased in water samples at the two tested levels of the pesticides (1 and 2 ppm) compared to the initial levels, control, (Tables 1-2). The data showed that ozone declined the amount of chlropyrifos in water samples following the all intervals of treatment. The removal percentages were 10.5, 96.3, 97.4 and 98.5% in samples spiked with 1ppm of chlropyrifos after 15, 30, 45 and 60 min, respectively, while they were 79.6, 93.9, 94.7 and 96.1% in samples spiked with 2 ppm. In case of cypermethrin, the removal percentages were 68.6, 90.5, 97 and 99.2% in water samples spiked with 1ppm following ozone bubbling for 15, 30, 45 and 60 min, respectively, whereas they were 30.5, 50, 94.7, 84.7 and 92% at 2 ppm fortification level in the same order.

b) Kinetic Studies

A biphasic model was assumed according to Sigma Plot (2011) in order to carry out the statistical study of the of either chlropyrifos or cypermethrin removal in water (equation 1).

$$C_t = A_0 e^{-\alpha t} + B_0 e^{-\beta t} \quad (1)$$

Where Ct is the recovered amount of pesticide at t min, A_0 and B_0 are the concentrations of the pesticide at t=0, while α and β are the disappearance rate constants for the first and second and phases, respectively. The half-life ($t_{1/2}$) of the exponential decay was calculated according to the equation (2).

$$t_{1/2} = (2.303 \log 2)/ \text{rate constant} \quad (2)$$

The data fitting results in case of all ozone treatment using second order kinetic showed that the coefficients of determination (R2) were 0.829 and 0.999 for chropyrifos as well as 0.9990 and 0.9510 for cypermethrin when the tested levels of pesticide were 1 and 2 ppm, respectively (Tables 5 and 6). The biphasic model is characterized by a rapid phase (first phase), and a much slower phase (second phase). This is clearly reflected in the half- live values ($t_{1/2}$), where $t_{1/2\alpha}$ values for chlropyrifis were 15.0 and 4 min, and $t_{1/2\beta}$ values were 15.1 and 17.96 min, at the spiking levels of 1 and 2 ppm, respectively, following ozone treatment. On the other hand, $t_{1/2\alpha}$ values of cypermethrin were 8.89 and 21.71 min and $t_{1/2\beta}$ values were 9.00 and 21.71 min at the spiking levels of 1 and 2 ppm, respectively, following ozone treatment.

The present findings are in accordance with those of many investigators who reported that the kinetics of pesticide degradation is commonly biphasic with a very rapid degradation rate at the beginning followed by a very slow prolonged dissipation (Alexander, 1994; Jones et al, 1996; Rigas et al, 2007 and Osman et al, 2009). The relative importance of the phases depends on the availability of the pollutants, hydrophobicity, and affinity for organic matter. So it is recommended to use such simple and non-toxic treatment to reduce such residues in water. The present study revealed that removing of either of chlropyrifos or cypermethrin from water depends on the contact times. Also, the amount of pesticide removed by water is

related to its water solubility and octanol–water partition coefficient.

One of the health concerns of using oxidants to degrade pesticide is the formation of toxic intermediates. The present study investigated the efficacy of ozone to remove chlropyrifos and cypermethrin from water. Ozone was assayed for treatment has a powerful oxidant having electrochemical oxidation potential of 2.0V, and thus, can modify the chemical structure of the selected pesticides creating derived by-products. If these by-products are more toxic than the parent pesticide, such washing treatments should not be utilized to reduce pesticide residue levels in water.

Ozone selectively reacts with compounds containing hetero-atoms such as S, N, O, and Cl via two different pathways, namely direct molecular and indirect radical chain-type reactions Gottschalk et al, 2000). Thus, pesticides, which usually have some hetero-atoms on the molecules, are often expected to be destroyed by ozonation (Reynolds, 1989). However, as has been found by many researchers, the reactivity of pesticides with ozone varies largely due to their diverse structural features (Reynolds, 1989; David et al, 1991) the characteristics of the wastewater to be treated, i.e., pH, concentration of ozone decomposition initiators, promoters and scavengers in the reacting medium (Glaze et al, 1987).

IV. Conclusions

Water is the basic necessity of life and water contaminated with toxic pesticides is associated with severe effects on the human health. Hence it is pertinent to explore strategies that address this situation of water safety especially for the developing countries where pesticide contamination is widespread due to indiscriminate usage. It is therefore of significance to evaluate simple and effective strategies as such ozone to enhance water safety from harmful pesticides. Due to its high oxidability, high reaction rate and absence of any secondary pollution, ozonolysis technique should be used in the sanitization of water especially in the treatment of pesticides which are difficult to get rid of. Results of this work, provided some basic concepts that can be helpful in water treatment for consumers. Therefore, the present study validated that ozone treatment is safe and promising processes for the removal of pesticides from water under domestic conditions. Results found in the present study must not be extrapolated to other pesticides.

Landscape Dynamics in Relation to Slope and Elevation in Garo Hills of Meghalaya, India using Geospatial Technology

By Sarma, K. Yadav, P.K & Sarmah, R.K.
Guru Gobind Singh Indraprastha University, Dwarka, Dew Delhi

Abstract - Garo hills region of northeast India is severely affected by sheet erosion mainly because of the age old tradition of shifting cultivation in the fragile hill slopes aided by other anthropogenic activities. Slope and elevation are important parameters that provide varieties of topographical feature for ecological patches. Vegetation is one of the major factors controlling soil erosion, while most soil erosion occurrences are due to the removal of vegetation and topsoil. Change matrix result indicates dynamic character of landscape.The present study is conducted to examine the landscape dynamics to relate vegetation cover with slope and elevation in three Garo hills districts of Meghalaya using temporal remote sensing data of 2001 and 2010. It is revealed that there is decrease in open forest during the study period while areas under dense forest and non-forest increased. This increased forest areas are confined in the high slopes which are inaccessible.

Abstract - Garo hills region of northeast India is severely affected by sheet erosion mainly because of the age old tradition of shifting cultivation in the fragile hill slopes aided by other anthropogenic activities. Slope and elevation are important parameters that provide varieties of topographical feature for ecological patches. Vegetation is one of the major factors controlling soil erosion, while most soil erosion occurrences are due to the removal of vegetation and topsoil. Change matrix result indicates dynamic character of landscape.The present study is conducted to examine the landscape dynamics to relate vegetation cover with slope and elevation in three Garo hills districts of Meghalaya using temporal remote sensing data of 2001 and 2010. It is revealed that there is decrease in open forest during the study period while areas under dense forest and non-forest increased. This increased forest areas are confined in the high slopes which are inaccessible. Considerable portionsin the vulnerable slopes are utilized for shifting cultivation which could be devastating. The present study shows more than a double fold increase in shifting cultivation in the high altitudinal area which is negative sign in terms of environment protection. Conversion of dense forest to open forest occurred in all the slope categories while alteration from open to dense forest predominated in the moderate and high slope categories. Maximum change from open to non-forest is in the slope categories of moderate andlow. There is considerable change from current jhum to open forest mostly in the moderate slope category. The maximum exchange between dense to open and open to dense occurred in the moderate slope and elevation areas.

I. Introduction

Landscape dynamic is concerned with the effect of spatial heterogeneity on ecological process. The physical environment including climate, geology, topography, plant succession, species extinction and evolution is often regarded as one of the most important factors controlling this heterogeneity of the landscape in mountain areas. Disturbances like shifting cultivation, landslide, floods, deforestation, urbanization, forest fire, and the ecosystem modification are responsible for landscape dynamics (Zimmermann & Eggenberg, 1990). Land use/ coverstudy shows present as well as past conditions of the earth surface and it is a central component and strategy for managing natural resources and monitoring environmental changes (Yadav*et al.,* 2012a). Landscape ecology is the study of patterns and structures across temporal and spatial scales. Spatial patterns observed in landscape result from complex interactions between biotic and abiotic processes and disturbances that occur within environment (Turner *et al.,* 2001). As changes occur in the landscape, the overall structure and composition of ecological community is affected, hence the importance of the study related to landscape is increasing for maintainingthe ecological diversity. Among different environmental factors that produce landscape patches slope and elevation are important parameters that provide varieties of topographical features (Sarma and Barik, 2010). The study of the slope is important not only it provides the variety of topographical features but also provides evidence for the interpretation of complex form of the existing landscape and reflects the evolutionary history of the landform (Fairbridge, 1968). Elevation pattern of landscape have been responsible for many factors like climate, isolation, species-area effects, historic events and biomass productivity of landscape patches (ICIMOD, 2000 and Acharya*et al.,* 2011).Vegetation is one of the major factors controlling soil erosion, while most soil erosion occurrences are due to removal of vegetation and topsoil(Bochet and Fayos, 2004 and Yadav*et al.,* 2012b). The shifting cultivation accounts for 60 percent global forest loss each year (Lele*et al.,* 2008) and in northeast India annual forest loss is about 10,000 sq.kmdue to this unhealthy practice. The total area affected by shifting cultivation (locally known as jhum) in northeast is estimated to be 44,000 sq.km (Singh, 1990). The jhum cycle in northeast has been decreased from 20 to 30 years in the past to about 5 years (Toky and Ramakrishnan, 1981)and in many areas even up to 3-5 years (Sarma, 2010a). Vegetation and land characteristics of Garo hills of Meghalaya, northeast India are heavily influenced by jhum activities (Figure 1) which have greatly amplified in recent decades with increase in human population, resulting in severely

fragmenting previously undamaged forest tracts (Singh *et al.,* 2011).

Remote sensing and geographical information system (GIS) coupled with computer programs allow to use landscape ecological principle for biodiversity characterization more efficiently (Yadav*et al.,* 2013). This technology has improved the efficiency of land use/ cover mapping and change detection with respect to slope and elevation pattern at landscape level. Digital Elevation Model (DEM) is a potential tool for terrain analysis at the varied spatial and temporal scales. The objectives of the present study include generation of slope and elevation maps of Garo hills districts of Meghalaya, preparation of land use/ cover maps for two different decades and to examine the dynamic relationships of slope and elevation with land use/ cover using temporal remote sensing data.

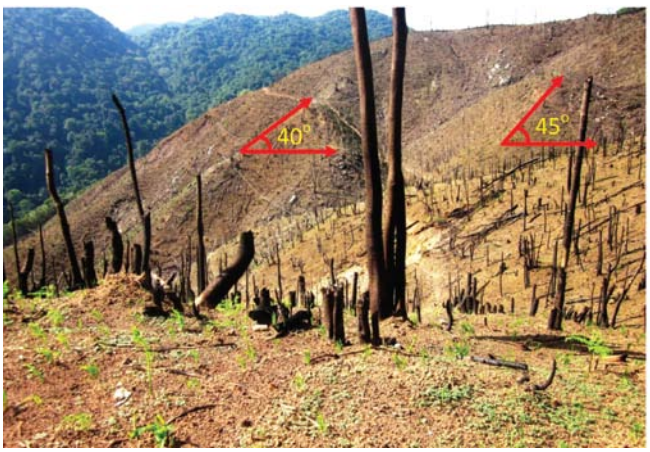

Figure 1 : Photograph showsthe base in different slopes for cultivation after removing the vegetation by slushing and burning in Nokrek biosphere reserve of Garo Hills

II. Study Area

The Garo Hills of Meghalaya consist of three districts viz., East Garo Hills, West Garo Hills and South Garo Hills (Figure 2). The districts are bordered in the north and west by Assam state, south by Bangladesh and east by West Khasi Hills district of the state. The districts are highly dissected with irregular terrain. The highest point of Garo hills is theNokrek peak with an altitude of 1,412m above msl. The total area of Garo Hills districts is 8,167 sq. km, which is 36.4 percent of the total area of the state(Sarma, 2010b). The soil of the districts is red loam and is poor in silica but rich in clay forming materials. The soil is generally loamy but often found clay to sandy loam. The surface horizon which is about 30 cm thick has colours ranging from reddish brown to dark reddish brown. The soils are rich in organic matter and nitrogen but deficient in phosphorous and potassium and they are acidic in reaction (Sarma and Barik 2012). The climate of the area is monsoonic and directly influenced by the south-west monsoon (Sarmaet al. 2004). The vegetation of Garo hills could be broadly classified into tropical and subtropical types depending on the altitude. The tropical vegetation is found up to an elevation of about 1000 m (Sarma et al. 2005).

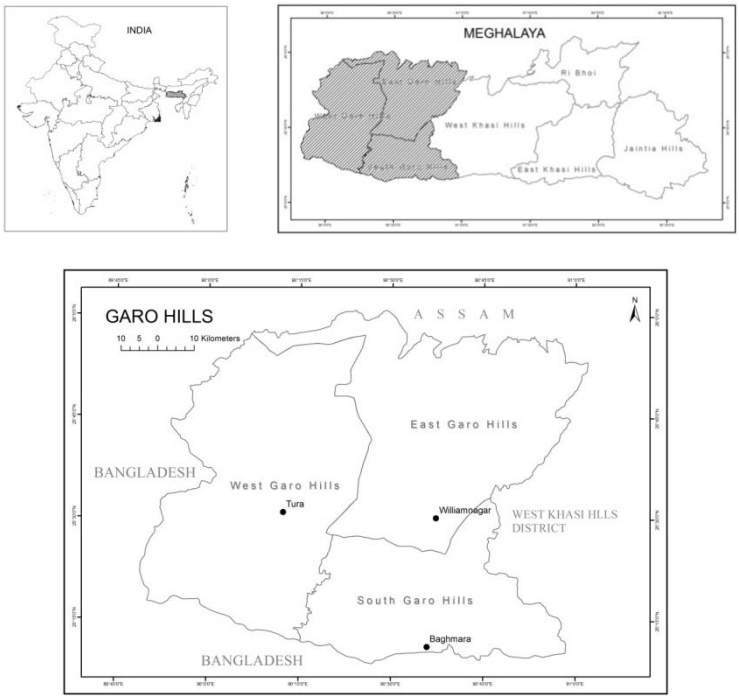

Figure 2 : Location of the study area

III. Materials and Methods

For landscape dynamic study temporal remote sensing imagery of 2001 and 2010 were utilized while for generating digital elevation model 2001 base year was considered (Table 1). The satellite images with bands (7) were stacked to prepare an FCC of bands 3(Red), 2(Green) and 1(Blue). The relevant topographic maps and image were geometrically rectified in 1:50,000 scale using geographic projection system UTM; speroid and datum used were WGS 84 with UTM zone 45N. The GIS and image processing software used are ArcGIS 10, Erdas Imagine 2011 and Quantum GIS 1.6. The paradigm for the study is described in Figure 3. Field verification was carried out during 1st February to 11th April 2012. Accuracy assessment of the classification schema is given in Table 2.

Table 1 : Details about the satellite imagery used for the study

IV. Results

Four land use/cover classes viz., dense forest (more than 40% canopy cover), open forest (10% to 40% canopy cover),non-forest (less than 10%) and current jhumhave been delineated for the study area (FSI, 2005). For slope three categories of high (above 14 degree), moderate (6 to 14 degree) and low (below 6 degree) are considered. Accordingly for elevation high (above 900 m), moderate (300 to 900 m) and low (below 300 m) categories are fixed.

It is found that in both the years the area under open forest (6,365 sq.km and 4,307 sq.km) has the maximum coverage which is followed by non-forest area (2,155 sq.km and 2,846 sq.km). There is a decrease of 2,058 sq.km open forest during the period while areas under non-forest increased by 1,591 sq.km. The area of dense forest increased in the decade(218 sq.km). This may be due to the efforts put by government and other organizations who are working for the regeneration of the natural forests of Garo hills. This increase is found mostly in the areas under moderate and high slope areas. Loss of open forest areas is found in all the slope categories where maximum loss found in low slope category. Similar trend is followed by non-forest areas. The high slope areas are also utilized for shifting cultivation which is vulnerable in terms of sheet erosion. In fact the areas under shifting cultivation in the high slope areas increased during the decade in considerable proportion (Table 3). Maximum areas of dense forest are concentrated in the high and moderate altitudinal areas which are mostly inaccessible. Open forests are dominating in the moderate and low elevation areas. Non-forest areas are found in excess in the low elevation areas. It is observed that in the high altitude the jhum area increased in more than double fold during 2001 and 2010 (Table 4).

Change matrix result indicates dynamic character of landscape. Here, land use/cover change matrix was categorized in eight classes viz., dense forest to open forest, open forest to dense forest, open forest to current jhum, open forest to non-forest, current jhum to open forest, no changes and others with respect to different slope and elevation categories. Conversion of dense forest to open forest occurred in all the slope categories. The alteration from open to dense forest predominated in the moderate and high slope

categories. Maximum change from open to non-forest is in the slope categories of low and moderate. There is considerable change from current jhum to open forest mostly in the moderate slope category. The maximum exchange between dense to open and open to dense occurred in the moderate slope elevation areas. Changes in other categories from open forest are found mostly in moderate and low elevation areas. In these two zones only changes occurred from jhum to open forest (Table 5 and Table 6).

Table 3 : Area statistics of LULC in different slope (in degree) category of Garo hills, 2001 and 2010

Land use/cover class	Slope Year 2001			Total	Slope Year 2010			Total
	Area in km^2 in low	Area in km^2 in moderate	Area in km^2 in high		Area in km^2 in low	Area in km^2 in moderate	Area in km^2 in high

V. Discussions

Based on Landsat TM (2001) and Landsat ETM+ (2010) data fourbroad types of land use/ cover were observed for the two different years in Garo hills. Classifications of these satellite imagery show that dense forest is confined mostly to the inaccessible area whereas other three types fall mainly in the moderate and low slope and elevation. The primary forest of the districts have been destroyed to a great extent by age old tradition of shifting agriculture which is extensively practiced in the hilly regions of the northeast India (Ramakrishnan, 1992; Yadav*et al.,* 2012). This activity has led to the development of a variety of successional plant communities ranging from open forest to recently abandoned shifting cultivation fields (Prabhu, 2004). In the present study, the proportion of open forestand non-forests increased with the decrease in slope. These areas represent a mosaic of degraded landscape owing to the gentle slope of the area. This finding is similar to that of Susana & Mario (2000) who reported that deforestation may be widespread in areas where slopes are relatively gentle. There is general trend for mountain ecology that with increasing altitude there exists good ecological conditions (Hamilton *et al.* 1999). This criterion is fulfilling in the present study. The findings of the present research reflect the similar results of Ramesh *et al.* (1997) who stressed that deforestation process characterized by removal of the smallest and most accessible forest patches, followed by other developmental and livelihood activities. The present study is supported by Sarma and Barik (2010) who revealed that even vulnerable slopes are not spared from shifting cultivation consequences of which could be devastating. Semwal*et al.* (2004) revealed that deforestation may be widespread in an area where slope is relatively mild in nature. Balaguru*et al.* (2003) established while relating vegetation with slope angles of Shervayan hills of Eastern Ghats that number of species increases with increasing degree of slopes. Their finding is very much supportive to the present research. Whereas, Smith *et al.* (2005) while studying relationships between geomorphology and tree density revealed all type of trees in all slope categories but density was high in the stable landforms despite slope variations.

VI. Conclusions

Garo hills districts support animpressive forest cover which is mainly concentrated in inaccessible areas and theseshould be conserved for biodiversity. It was observed in this study that the remote forest areas are also slowly encroached by the local people for shifting cultivation, mining and other activities. The districts have witnessed the conversion of forests to other non-forest areas during the last decade. This alteration needs to be checked immediately. After shifting cultivation the fallowland should be allowed to regenerate at least 15-20 years before another cycle. The short cycle not only effects soil fertility but also exposes the top soil for erosion. Further, the conversion of forest areas into other land use should be properlyplanned. The most important step that needs to

be undertaken to prevent the area from further deterioration is to educate the people and make them aware of the consequences of the effect of deforestation, mining and shifting cultivation.Landscape dynamics study is important to understand and assess the changes in natural resources due to various natural and anthropogenic reasons. The findings of the present study could be useful for management authority for making strategies for management of natural resources and monitoring its changes in due course of time. Temporal remote sensing data with detailed field observation could be an authentic tool for studying the landscape dynamics in any part of the globe which are environmentally fragile.

Urban Vacant Land and Spatial Chaos in Ogbomoso North Local Government, Oyo State, Nigeria

By J. O. IGE & T.A. Atanda
Ladoke Akintola University of Technology, Ogbomoso, Oyo State, Nigeria

Abstract - Vacant land is seen as important component of urban environment capable of generating a detrimental effect on quality of life and the living environment. The study attempts to examine the characteristics, distribution pattern, utilization and the attendant challenges of urban vacant land within Ogbomoso north a local government area in Oyo State, Southwestern Nigeria with a view to assessing the level of maintenance of the vacant lands. In order to achieve these objectives, both primary and secondary data were employed. Primary data were gathered through direct survey and interviews. Simple random sampling was used to purposively select 320 adult interviewed from a compiled list of households obtained from National Population Commission. Secondary data were obtained from internet, books and journals. Data were analyzed making use of descriptive and inferential statistics to present discussion.

Urban Vacant Land and Spatial Chaos in Ogbomoso North Local Government, Oyo State, Nigeria

J. O. IGE [α] & T.A. Atanda [σ]

Abstract - Vacant land is seen as important component of urban environment capable of generating a detrimental effect on quality of life and the living environment. The study attempts to examine the characteristics, distribution pattern, utilization and the attendant challenges of urban vacant land within Ogbomoso north a local government area in Oyo State, Southwestern Nigeria with a view to assessing the level of maintenance of the vacant lands. In order to achieve these objectives, both primary and secondary data were employed. Primary data were gathered through direct survey and interviews. Simple random sampling was used to purposively select 320 adult interviewed from a compiled list of households obtained from National Population Commission. Secondary data were obtained from internet, books and journals. Data were analyzed making use of descriptive and inferential statistics to present discussion. The results showed that the nature of urban vacant land utilization is dynamic and that they owned their existence to diverse purposes. The spatial distribution of these vacant lands was conformed to regular pattern but spread across the diverse spatial and socio-economic segments of the study area. Less vacant lands were found in the centre of the city while their sizes increased as one moved towards the fringe of the city. Poor management turned out the vacant lands to dumping sites, hideouts for hoodlums and indiscriminate sitting of artisan workshops. The result of research hypothesis showed a strong relationship between the size and value of vacant lands in the study area. It was, however, concluded that the uses of vacant lands were generally poor undermining public health and safety, owing to concomitant low level of public awareness and inadequate system of social support. The study therefore underscored the need for efficient back up of institutional outfit to obviate danger and risk of uses.

Keywords : contiguity, environment, facilities, management, vacant land.

I. Introduction

In Nigeria, as in most other developing countries, there is no issue more topical than vacant land management if we are serious in enhancing the livability of urban environment. Therefore the uses of urban vacant land should not be overlooked in urban awareness and in urban studies as these uses play a daily role in the lives of urban dwellers. However, rapid spatial growth has become one of the most notable features of urban centres in Nigeria in the last few decades. This is a result of concentration of socio-economic, recreational and administrative facilities the nation could boast of in urban centres. In developing countries like Nigeria, this urban growth has not been marched by a proportional increase in services, facilities and an efficient urban management. This has led to case of isolated, haphazard and incidental vacant spaces with their attendant negative consequences of the environment which led to urban decay and environmental degradation (Odedare, 1998). Olatubara, (2004) also stresses that the accelerating growth of urban centre has brought stresses and strains upon the city environment. Significant among the problems are those of overloading on existing facilities thereby causing traffic congestion, inadequate housing, slums, pollution in all its ramification, poor environmental quality and indiscriminate use of urban vacant land. Kufoniyi (1997) opined that the environment is made up of scenes of uncollected garbages and the infilling of vacant spaces and parks which contribute to the environmental degradation of urban areas. He also identified encroachment and illegal occupation of land as part of the urban land.

Nigerian cites have continued to grow at a faster rate than the facilities provided. The phenomenal rate of urbanization in Nigeria is considered as one of the highest in the world (Oyesiku, 2004). As increase urbanization exerts more pressure on urban facilities, the supply of these facilities is increasingly becoming inadequate. Since the last four decades, there has been unprecedented interest in different nature of urban problems. Unfortunately, nothing has more caused urban decay than the indiscriminate use of urban vacant land and vulgar disposition to vacant land management, and more than elsewhere Nigeria has visibly failed in paying attention to this component of urban structure.

Vacant land is a term of reference that has different interpretation for different people. Some refers to vacant land as land within the urban area that is not devoted to development like residential, commercial, industrial etc. Others refer to it as land on the margin of the urban area that is undeveloped. Generally, vacant land provides a function of creating openness in the urban expanse (space). In this study however, vacant

Author α : Department of Urban and Regional Planning, Ladoke Akintola University of Technology, PMB 4000, Ogbomoso, Oyo State, Nigeria. E-mail : igeboanerge@yahoo.com
Author σ : Oyo East Local Planning Authority, Kosobo, Oyo City, Oyo State Nigeria.

land within the cities is defined as the area generally free from development or developed with low intensive uses. Vacant lands are parcels of land that are not devoted to any functional use or that have been by-passed by developmental activities of the urban area. Vacant land are used as reference to urban open space that are not devoted to any functional use, but not to vacated or razed buildings (Olaleye, 1998). Urban open spaces are parcels of land that have been by-passed by the developmental activities of the urban area and that exist as enclaves surrounded by parcels that have been converted to one or more types of urban use. They account for about one-fifth of the land area of the city (Falade, 1985).

Regarding the overall spatial setting where vacant land are found, one might consider the location of these parcels relative to different types of developed urban land. These spatial relationships can be expressed by means of coefficient of correlation between the amount of buildable vacant land in an area, such as a quarter-section and the distance to a specific major centre or focus in the urban centre, such as the central business district (CBD), a major commercial centre or an industrial district. Most important to note that in the course of planning and developing a town, the provision of open spaces is very vital among other things for hygiene and aesthetic; relaxation and entertainment, personal and social development; recreation etc. The planning and growth of human settlements is very vital to enable a community lives a meaningful and satisfying life.

Previous studies have shown that a sizeable percentage of urban problems arise from the negative impacts generated by the unguided incidental urban vacant land.(Filani, 1985; Falade, 1985; Onibokun, 1992) Moreover, they also slow down the space of economic growth. This study seeks to mitigate these negative effects and enhance the positive ones on the environment by the aid of technical objectives policies to properly maintain urban vacant land in Nigerian cities. However, a case study of Ogbomoso North Local Government, a typical historical Yoruba traditional city coping with contemporary growth and spontaneous anarchical and unguided developments shall be brought to focus. In the study area, there are many undeveloped vacant lands within the built-up area and the phenomenon keeps increasing. This study therefore intends to examine the concept and nature of urban vacant land, its characteristics, utilization, management and various challenges with a view to proposing the prudent use of urban land in the study area.

The study aims at studying the characteristics utilization, management and the attendant challenges of urban vacant land within the study area with a view to proffering objective policy recommendations for an effective management of urban vacant land in the study area. Specific objectives of the study are to: (a) *examine the location, size, use, ownership and value of identified urban vacant lands,* (b) *study the contiguity of the urban vacant lands with the predominant use in the area,* (c) *evaluate the state of the vacant spaces within the study area, with a view to identifying their level of maintenance.*

The hypotheses that guide this study are stated in null and alternate forms;

(i) *There is no relationship between the size and values of urban vacant land.* (H_0-Null hypothesis) *There is a relationship between the size and value of urban vacant land* (H_1-Alternative hypothesis).

(ii) *There is no relationship between the size of urban vacant land and its distance to the city centre* (H_0-Null hypothesis). *There is a relationship between the size of urban vacant land and its distance to the city centre* (H_1-Alternative hypothesis).

(iii) *There is no relationship between the value of urban vacant land and its distance to the city centre* (H_0-Null hypothesis). *There is a relationship between the value of urban vacant land and its distance to the city centre* (H_1 Alternative h ypothesis).

II. Materials and Methods

a) The Study Area

Ogbomoso is located on the main highway connecting the North and South West of Nigeria. The town which is the second largest in Oyo state (next to the capital) is (104km) one hundred and four kilometers her state capital – Ibadan and forty-eight kilometers (48km) south of Ilorin – the Kwara State Capital. The town (Ogbomoso) lies on latitude $8^{o}07^{1}N$ – $8^{o}16^{1}N$ of the equator and longitude $4^{o}16^{1}E$ – $4^{o}30^{1}E$ of Greenwich meridian time. The town is divided into two Local Government and they are; Ogbomoso North and the Ogbomoso South Local Governments. Their headquarters are at Kinnira and Arowomole respectfully. An American Baptist Missionary estimated the population of Ogbomoso in the 1850 to be 25000 by 1952, the town had grown to a population of 139,500 (Kraft Askari 1969 Pp35) and by 1986; the population was 564,465 (Ogbomoso Local Government Publication, 1986, Pp10)

b) Methodology

The major procedure used in carrying out this research was a cross-sectional procedure in which all necessary information was collected from a set of observed vacant land within the study area. Both primary and secondary sets of data were colleted and analyzed for the study.

Primary data collection was through oral interview and questionnaire administration. Oral interview schedules were conducted with the Director of Town planning, Ogbomoso North Local Government. The questionnaire elicited information about the respondents, sex, age, religion, income, occupation, highest educational qualification, perception of

individuals about the vacant land and the environmental problems created by the available incidental vacant land among others. The questionnaire were administered on the residents and the users of the vacant land to collect information on the impact of the urban vacant land on them and what they would want to be done to such spaces.

The opinion surveys were viewed together with the market value, the location and the predominant use in the area to arrive at the optimum use for the vacant plots. With a view of knowing the appropriate market value of land, some estate valuers "land agents" were consulted in the study area and an open market valuation was also adopted to elicit information on how much the people could afford to buy a particular piece of land if it were to be offered for sale. Oral interviews were also held with occupiers or owners of the properties and the adjourning properties. Secondary data for this study were sourced from journals and books.

The structured questionnaire was used with pre-coded answers to the questions from which respondents were able to select best alternatives that were suitable their opinions. The questionnaire were randomly served on the residents of the adjoining plots and the occupiers (if any) of the identified vacant lands. The second types of questionnaire were filled on inspection of each plot by people employed to record information about each vacant plot's characteristics. A total of three hundred and twenty questionnaires were administered while two hundred and forty copies were retrieved.

The areas where the vacant land or undeveloped plots were situated were selected for sampling. The study area was divided into six zones and samples were drawn independently and randomly from each zone. In each of these zones or localities, respondents were selected using the random technique. In most cases, heads of the households were first respondent. However, where heads of households could not be found, male or female adults (who have right to vote) above the ages of 18 years were always in the forefront to respond to the questions. Notwithstanding, children were given the privilege of responding to the questions.

The data collected through the questionnaire, pilot survey and interviews were processed through the use of statistical packaged for social scientists (spss). Descriptive statistical analysis was employed to obtain the frequencies, distribution and percentages. Frequency count, tables and percentages were used to enhance vivid discussion of result. Correlation (coefficient) analysis using Pearson product moment was adopted to test the research hypotheses.

III. Discussion of Findings

The following were the research findings for the study:

a) Distance of Respondents with respect to vacant land in the study area

With a view to knowing the public opinions about impact of urban vacant land on the quality of life on adjoining households, a total of two hundred and forty questionnaires were retrieved out of the three hundred and twenty (320) administered randomly on occupants of adjoining undeveloped plots in the localities chosen for the study.

A study of the distance of the respondent to the vacant plots showed that (45 percent) of the respondents live next door to vacant plots 24 percent lives within 100 meters from one vacant plot or another, (22 percent) of respondents live at more than 100 meters while the remaining (10 percent) respondents lives at more than 200 meters. See Table1.

Table 1 : Distance of Respondents to the vacant land

Distance of Respondent	Number	Percentage (%)
Next plot	108	45
Within 100m	56	23.33
Above 100m	52	21.67
Above 200m	24	10.00
Total	240	100.00

Source : Field survey, December, 2011.

b) Characteristics of land ownership in the study area

Significant majority of the respondent (72.5%) provided information on the ownership status of the vacant plots in terms of whether privately or publicly owned. Forty-seven (47) of the vacant plots identified were held by individuals while the remaining eight (8) were held by public institutions. A further analysis shows that, out of 47 plots held by private individuals, 39 were held by Ogbomoso indegenes while the remaining 8 plots were held by other indigenes but not of Ogbomoso origin. Out of the eight held by public institutions, two undeveloped plots belonged to the Christian Association of Nigeria (CAN), another 2 plots belonged to the Anglican Communion/ Diocesses, one was held by the Ogbomoso Chapter Muslim Society of Nigeria and the remaining three belonged to the government (Ogbomoso North and Oyo state Governments). See Appendix 1.

When asked about the visitation of owners to the vacant lands, 13 percent could identify those that visit their plots on monthly basis, one percent identified those that visit bi-monthly, 18 percent say the owners rarely visit the plots, 8 percent could identified those that visit annually. Five (5) percent visit on weekly basis while about 56 percent of the respondents did not know when owners visit their vacant plots.

c) Perversion of current vacant land use in the area

The field survey as represented in Table 2 revealed that not all the urban vacant lands within the town were really vacant or bare (that is, those that were not put to any use and most of the time were bushy), this represents about 15 percent of the identified vacant land. These undeveloped plots were in most cases being used as hideouts for hoodlums and about five cases of robbery were reported to have been

perpetuated through the use of these undeveloped/bushy plots. Nine plots (about 16 percent) were being temporarily cultivated. There were seven plots (13 percent) being used for block making. 11 plots (20 percent) being used for automobile mechanic workshop, 16 percent of such plots have been unofficially committed to refuse dumping sites. 5 plots were being used by children as playing ground. The remaining six (6) undeveloped plots (11%) were committed to petty trading activities.

The study also established that the large percentage of urban vacant land in the area was being put to one temporary use or the other which was in most cases not compatible to the dominant uses in the area. For instance, about nine (9) refuse dumping grounds were found located at various places within the residential locality. This has been proved to a greater extent in contributing to pubic health hazard like outbreak of diseases such as cholera, malaria, typhoid, tuberculosis, pneumonia (upper respiratory infection).

Some of these vacant lands were not put to any use and were either taken over by bush or junk yard and this has been seen to be generating negative effects on the occupiers of adjoining parcels of land. For instance, eight vacant plots were found being taken over by bush and served as hideout for hoodlums who threatened lives and properties of the residents and users of the adjoining parcels of land.

The study revealed the non-existence of conscious planning for open spaces. There was no designated open space in the study area. However, there were spaces between buildings, spaces in and around the area, spaces within or enclosed by the individual yards and spaces along the streams and streets which were often used as depots of refuse and human wastes. Likewise, after completing building operations, the remaining unbuildable parts of land were always used in providing commercial kiosks, provision of additional rooms to the house due to the present dire need of places to trade and places of abode respectively.

It was observed that the rights of ways were also discovered to have been taken over by mechanic workshops, street trading, places of worship even right under high voltage electric cables which endanger lives of many inhabitants of the study area.

The study shows that there is a general lack of proper rational uses of land and this makes the development of land for various activities to grow in most haphazard manner resulting in incompatible land uses. The problems and the challenges posed by the rapid rate of uncontrolled and unplanned urban growth are immense in the study area. Most of the localities are growing without adequate planning. People live in sub-standard and sub-urban environments plagued by slum, squalor and grossly inadequate social amenities. Low level of awareness on the part of the people, absence of effective advocacy and inappropriate programmes of development have further compounded the problems of growth and development of the study area. The findings revealed that the area is devoid of a well landscape space with facilities for different forms of recreation like active and passive recreation of different ages groups.

Instead, the spaces have been so bastardized by turning them to dumping sites, farmlands, mechanic workshop, block making industries etc. thereby making them to loose their potentials and proper functional uses they could have been

The land use study revealed that the area is a predominant built up residential area. Other uses spring up in the area with little or no regard for conforming uses or zoning policy.

Table 2 : Current Vacant Land Uses in the Study Area

Uses	Number	Percentage)%
Refuse dumping	9	16.36
Mechanic workshop	11	20.00
Trading activities	6	10.91
Farming	9	16.36
Bare (hideouts)	8	14.55
Block making	7	12.72
Playing ground	5	9.10
Total	55	100.00

d) Contiguity of Ogbomoso North Vacant Land

The study shows that most of the identified vacant lands exist in isolation. Only seven of them representing about 13 percent were contiguous with another vacant land.(See Table 3) Owners of the seven (7) contiguous plots were not ready to surrender them for any consolidation programme. Their reasons vary from one owner to another. Three argued that the land (undeveloped plot) symbolize their attachment to their origin, two lamented unstable and uncommitted nature of the government to such programmes of resettlement in the past while the remaining two said that their reasons are purely personal. The study again established the fact that vacant urban land is the part of the overall urban environment and that the vacant land within cities owned their existence to diverse reasons.

Table 3 : Contiguity of Ogbomoso North Vacant Land

Nature of plots	Number	Percentage (%)
Plots that are contiguous	7	12.72
Non-contiguous plot	48	87.28
Total	55	100.00

Source : Filed survey, December, 2011.

e) State of Maintenance of Vacant land in the Study Area

Assessment of maintenance level of these undeveloped plots within the built up areas shows that 55 percent of them were poorly maintained which resulted in them being overgrown with bushes, taken

over by refuse and human wastes as dumping sites and constituting "eye sore" within the urban setting. Those that could be taken as being fairly maintained represent 29 percent while those that were adequately maintained represent 16 percent of the identified urban vacant land in the area. (See Table 4).

Note:

Good - The plot is adequately maintained

Fair - The level of maintenance has not started generating negative impacts

Poor - The plot is not adequately maintenance in terms of weeding, cutting, sweeping and general hygienic and is generating lots of negative impacts to its surrounding. This study has revealed some of the ways in which large parcel of urban land are being utilized in a less intensive manner, if put to use at all. The study also dealt with various ways in which urban vacant land are developed/evolved, managed and administered by both public and private sectors. Moreover, the study showed the dynamic nature of urban vacant land utilization because their present roles are likely to change from one use to the other with the passage of time, such as vacant land being utilized for functional uses.

For instance, the field survey revealed that various functional uses (such as residential, commercial, institutional etc.) were being proposed to developed some of the identified vacant land in the study area especially those that were classified or certified as fairly maintained.

Table 4 : Current state of maintenance of urban vacant land in the study Area

Level of maintenance	Number	Percentage (%)
Poor	30	54.55
Fair	16	29.09
Good	9	16.36
Total	55	100.00

Source : Filed survey, December, 2011.

Therefore, since their existence was part of the urban scenario, it then becomes imperative that a pragmatic approach should be evolved to manage them within the larger context of urban environment planning and management.

IV. Testing of Hypotheses

The details of computation of the correlation coefficient are presented in table5.10.

Extracting from the calculation using the pearson product moment correlation analysis between (i) the size of identified vacant plots and their corresponding distances (in kilometers) to Oja'gbo (the city centre); (ii) the distance from the city centre (Oja'gbo) and the appropriate value of plots; (iii) the size and the value of plots.

The relationship between distances and sizes of identified vacant plots were computed and found to behave in accordance with the expectation. The correlation analysis shows a positive relationship of +0.9 at 0.05 level of significant between the distance and the size, which implies that the farther one moves away from the city centre, the bigger the sizes of the undeveloped plots. For example, Takie is closer to Oja'gbo than Oke Aanu. When the sizes of vacant plots at Takie area range between 20 by 20 square meters to 40 by 30 square meters, the sizes of the vacant land at Oke Aanu area range from 25 by 30 to 35 by 70 square meters. This could among other reasons be explained by the larger concentration of development within the city centre and scanty development as one move to the outskirts of the town. Another reason could be larger parcel of land acquired by the Government at the periphery for future development. For instance, a large parcel of land was acquired as a new site for Ogbomoso Girls High School located at Oke Aanu area. Moreover, a large parcel of land was allocated for the Federal Government low cost Housing project along Ayoka road. Another reason could be the fact that new areas always grow out on layouts where adequate provisions are made for roads, buffer zones, recreational centers, neighborhood playing ground and so on. These among other things account for the reasons why there are bigger sizes of vacant land at the periphery of the city than the city centre.

The results also show that there is a strong relationship between the size and the land value as indicated by the positive correlation of +1 at 0.05 level of significant that existed between sizes and values of urban vacant land identified in the study area.

It shows that, the larger the sizes of the vacant land the higher its economic value. For instance, the appropriate values of vacant land with sizes 20 by 20 and 20 by 25 square metres range from 50,000 to 60,000 naira while those with sizes 30 by 30 square metres and above range from 65,000 to 140,000 naira.

V. Recommendation and Conclusion

In spite of a myriad of problems and challenges of urban vacant land as identified in this study, a maximum practicable degree of aesthetic environment can still be achieved by proper utilization and management of the vacant land. Most of vacant land with reasonable sizes could be re-designed so as to add glamour to the town and afford the kids and adults with appreciable facilities to recreate. This will encourage and improve the active recreational habit of the generality of the populace.

It is therefore suggested that a redevelopment proposal for the vacant land of considerable sizes within the city (especially those that belong to the government) be made. The redevelopment proposal should make provision for the aged people relaxation area, children active relaxation area; children passive relaxation area, adult active and passive relaxation areas. Other provisions should include parking lots, water fountain

service building, security etc. All these facilities are to be located with due regard to compatibility, accessibility and maximum security.

However, other undeveloped plots within the study area should be protected, conserved and adequately maintained. The adequate maintenance will enable it achieve the objectives of its existence. The unkempt ones which are either bushy or turned to dumping sites could be uniquely designed so as to enhance a greater utilization, maintenance and compatibility to the surrounding uses.

Based on the findings of this study and knowledge gained from field survey, a stern government action needs to be taken against the occupation of the right of ways by the automobile mechanic, the artisans that occupy the right of ways of high voltage electric cables and unauthorized vendors. Strategic locations of mechanic workshops within the city should be introduced and the mechanic village programmes on a sustainable basis should be resuscitated. The artisans and vendors should be made to leave the right of way of high voltage electric cables. This will reduce the risk of human lives and add to the aesthetic of urban form.

The study revealed that the management of these vacant lands is under the individuals, families and some public institutions. The study showed that the urban plots could be better managed if handled by the community organization. The involvement of Landlord Association of all quarters or localities in the management of vacant plots in their domains will go a long way in checking some of the negative externalities of these vacant plots as earlier mentioned. Individuals and the community in which landlord associations are, are the immediate occupants or users and they live within the area where the vacant land exist, so they will be in better position to manage, monitor and protect the spaces. They can properly handle the management and monitoring of urban vacant land in the study area so as to reduce to its barest minimum the negative challenges of vacant land in Ogbomoso North Local Government. The suggestion made above can be effective if backed up by efficient institutional outfit. Public authorities of all levels must support development control at local level if vacant land generated nuisance is to be prevented in our communities. Also, long-term solution must be set in motion whilst at the same time immediate needs must be addressed in order to confront the circumstances that generate or facilitate urban decay, Therefore, what is required to maintain proper utilization of vacant spaces is not a new creation of new bodies or institutions. What government needs do is to strengthen the capacity of the existing bodies (Town Planning Officers and Environmental Health Officers) in term of personnel, training and equipment in controlling development, monitoring environmental sanitation and in the discharge of the professional and legal obligations imposed by law. Conclusively, we must all work together for the collective good. Environmental management is everyone's responsibility if we are to enhance the livability of our community.

Significant of Geology and Geophysical Investigations in Groundwater Prospecting. A Case Study from Hard Rock Terrain of Southwestern Nigeria

By Ariyo, S.O & Adeyemi, G.O.
Olabisi Onabanjo.University, Ago-Iwoye, Nigeria

Abstract - Electromagnetic (EM) profiling and VES are the two complementary and widely used geophysical methods in the delineation of basement regolith and location of fissured media and associated zones of deep weathering in crystalline terrains. In many instance, reconnaissance EM surveys are used to locate aquiferous zones such as fractures, faults and joints while Vertical Electrical Sounding on the other hand provides information on the vertical variation in electrical resistivity with depth. It is commonly used to assess the reliability of the fractures delineated from EM survey (Ariyo, et al, 2008, Olayinka *et al,* 2004).

Significant of Geology and Geophysical Investigations in Groundwater Prospecting. A Case Study from Hard Rock Terrain of Southwestern Nigeria

Ariyo, S.O [α] & Adeyemi, G.O. [σ]

I. Introduction

Electromagnetic (EM) profiling and VES are the two complementary and widely used geophysical methods in the delineation of basement regolith and location of fissured media and associated zones of deep weathering in crystalline terrains. In many instance, reconnaissance EM surveys are used to locate aquiferous zones such as fractures, faults and joints while Vertical Electrical Sounding on the other hand provides information on the vertical variation in electrical resistivity with depth. It is commonly used to assess the reliability of the fractures delineated from EM survey (Ariyo, et al, 2008, Olayinka *et al,* 2004).

This study is focused on the significant of geologic mapping and integrated geophysical methods in assessing the groundwater prospect of a typical basement terrain in some parts of Southwestern Nigeria. Figures 1 and 2 shows the VLF-EM traverse and VES points superimposed on the geological map of the study area. Fig.1 is Akaka area and Fig.2 is Fidiwo/Ajebo area of Southwestern Nigeria. The study area is underlain by the Precambrian Basement complex rock of Southwestern Nigeria (Rahaman, 1988). The basic rock identified in Fig.1 is Biotite granite gneiss while in Fig.2 the area is underlain by Biotite Granite Gneiss, Migmatite Biotite Gneiss and Schists.

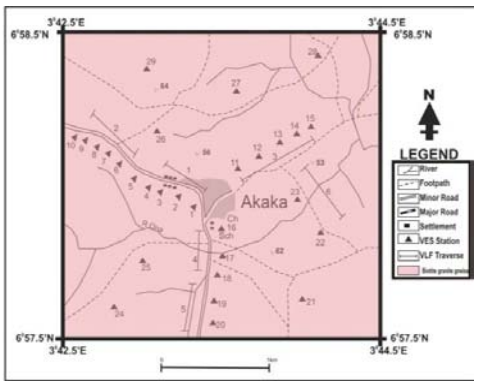

Figure 1 : Site and Geological Map of Akaka, Southwestern Nigeria

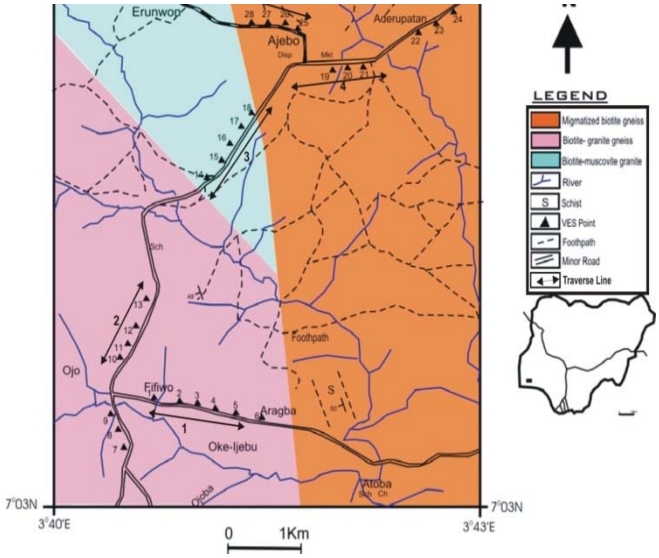

Figure 2 : Site and Geological Map of Fidiwo/Ajebo, Southwestern Nigeria

II. Materials and Methods

A detailed geological mapping and interpretation of satellite imageries map of the area were carried out before as a reconnaissance tools before the detailed geophysical investigation was carried out.

Two geophysical methods were employed in the course of this research work and these are Very Low Frequency Electromagnetic (VLF-EM) and Electrical Resistivity methods.

These two methods are both responsive to water bearing fractures columns due to their relatively high-bulk electrical conductivities. Fifty-seven (57) Vertical Electrical Sounding (VES) points were probed in the study area and Eleven (11) VLF-EM traverses were also occupied.

The VLF-EM data were presented as profile by plotting filtered real and imaginary values against their station positions while partial curve matching and computer iteration techniques were adopted in the interpretation of VES data. From the curve matching technique initial estimates of the resistivity and thickness

Author α : Department of Earth Sciences, Olabisi Onabanjo.University, Ago-Iwoye. Nigeria. E-mail : ariyof@yahoo.com
Author σ : Department of Geology, University of Ibadan. Ibadan. Nigeria.

of the various geoelectric layers at each VES station were obtained. These were later used as a starting model for a fast computer interpretation (iteration) technique called Resist (Vander Velpen, 1988).

III. Results and Discussion

The results obtained from the EM and VES data interpretation are presented as profiles, geoelectric section and maps. Fig.3a-c shows typical VLF-EM anomaly profiles from the study area. The EM anomalies vary greatly; some of the anomaly peaks are narrow and sharp while others are broad with varying width extent. Several major linear features (suspected geological interfaces, with positive peak filtered real amplitude were delineated using characteristic feature of coincident inflection on real component anomaly curves with positive peak on filtered real anomaly and only small anomaly in the imaginary parts. Zones with peaks positive filtered real anomalies are considered priority areas for groundwater accumulation since they often correspond to zones with high conductivity characteristic of water-filled fractures or fault (Olorunfemi *et al,* 2004, Ariyo *et al,* 2009) or effect of appreciable depth to bedrock or lithological variations within the consolidated regolith.

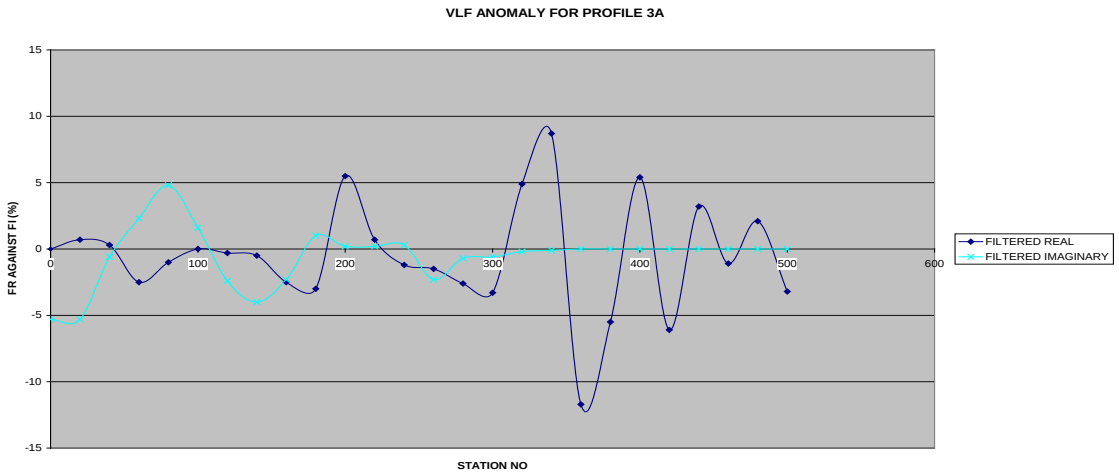

Figure 3a : VLF-EM anomaly Curve for Ajebo Profile

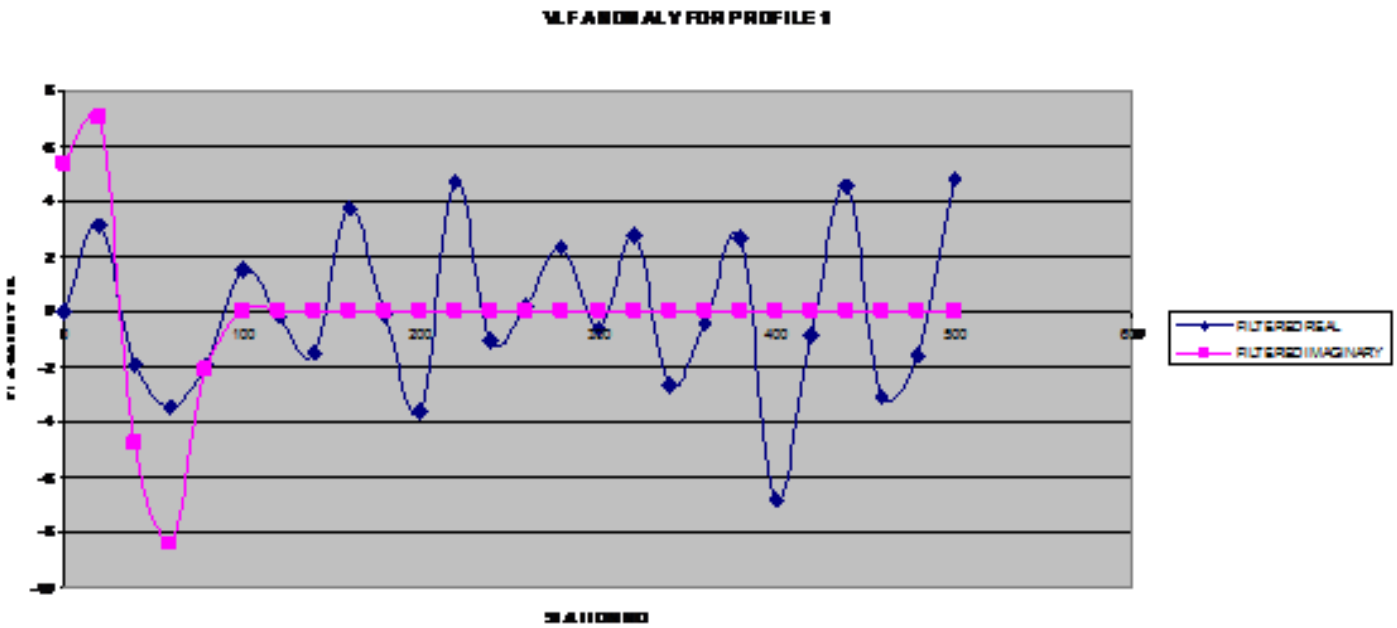

Figure 3b : VLF-EM anomaly Curve for Fidiwo profile 1

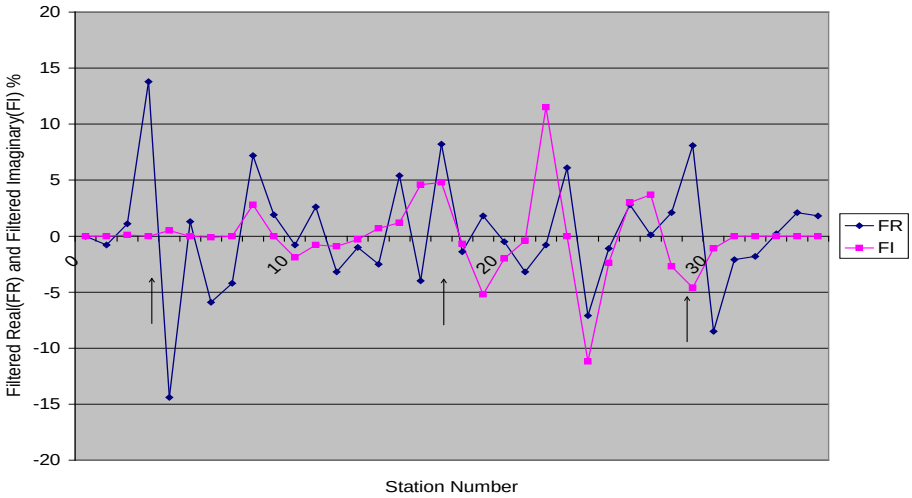

Figure 3c : VLF-EM anomaly Curve for Akaka profile 1

The results of the soundings conducted in the area studies reveal the existing of 3 to 5 geoelectric layers. The geoelectric layers comprise of topsoil made up of sandy clay, clayey sand and gravel. The weathered layers, which constitute the 2nd to 4th layers as the case may be has layer have it resistivity varied from one place to another and constitute part of aquiferous layer in the study areas. The last layer which consists of fracture/fresh bedrock depending on their resistivity values. The overburden thickness varies from 16.3 to 91.5m.

The H type curve is the most predominant in the study areas, which typifies a typical basement complex environment contains a low resistivity intermediate layer underlain and overlain by more resistant materials (Olayinka and Mhachi, 1992). In Basement area, the intermediate layer of the H-type is commonly water saturated and it is often characterized by low resistivity, high porosity, low specific yield and low permeability (Jones, 1985) with the main aquifers found at the base of the weathered profile where mineral decomposition resulting from in-situ chemical weathered as produced a gravel-like material of moderate to high permeability (Jones, 1985 and Acworth, (1987). like material of moderate to high permeability (Jones, 1985 and Acworth, (1987). Fig.3a & b shows the geoelectric sections that relate the VES stations. The geoelectric section reveals the subsurface variation in electrical resistivity and attempts to correlate the geoelectric sequence across the profiles. The geoelectric inter-pretation inferred for the VES station are topsoil, weathered layer, which may be lateritic clay, clayey sand, sandy and sandy clay and the basement which may be fractured or fresh basement base on their resistively values. The figure shows that the study area is characterized by moderately thin weathered layer in some of the VES stations which are < 20m thick. However the partly weathered/fractured basement unit is significantly thick and extensive with tendency for large storage capacity and significant groundwater yields capacity.

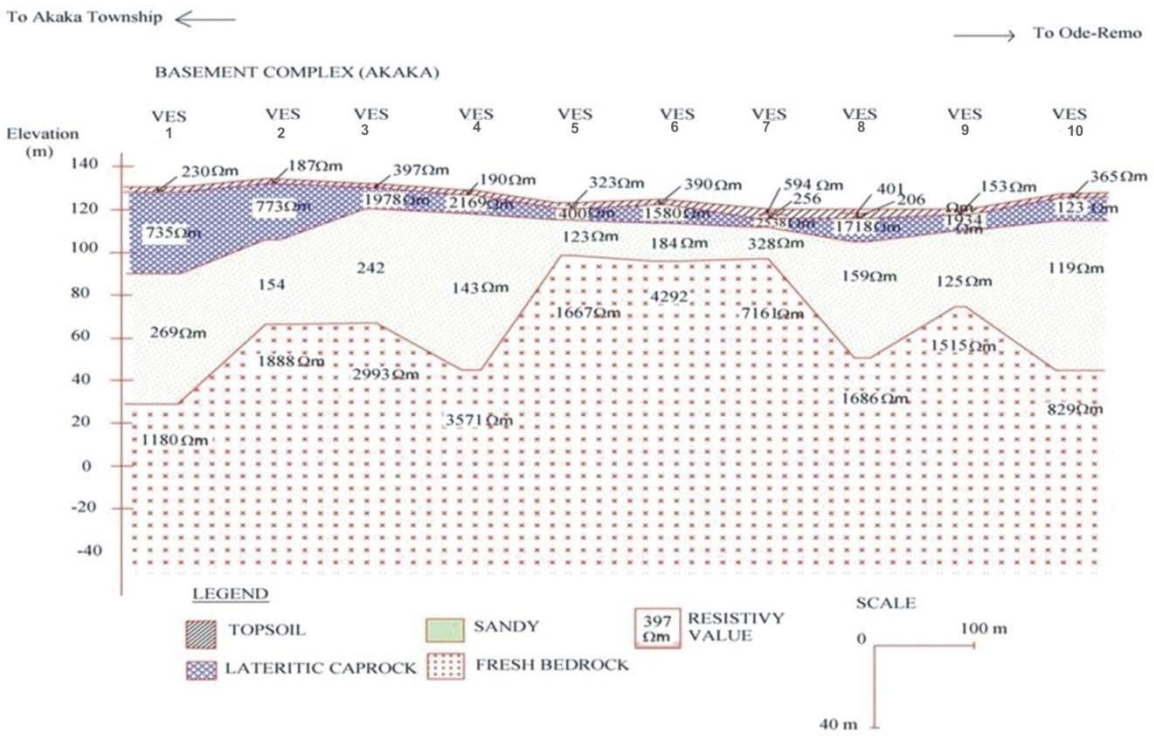

Figure 4a : Geoelectric Section Along VES 1-10 in Akaka area

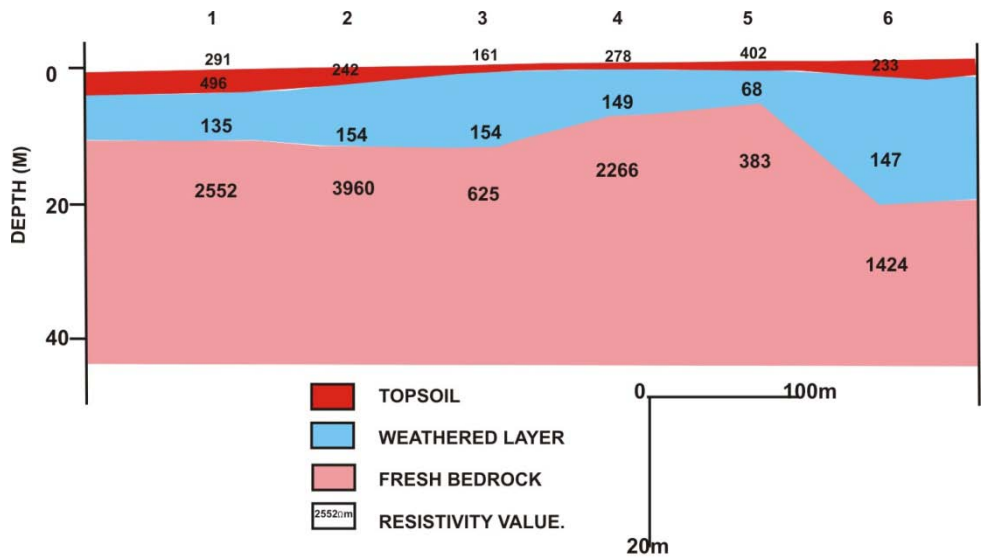

Figure 4b : Geoelectric Section of Along VES 1-6 in Fidiwo Area

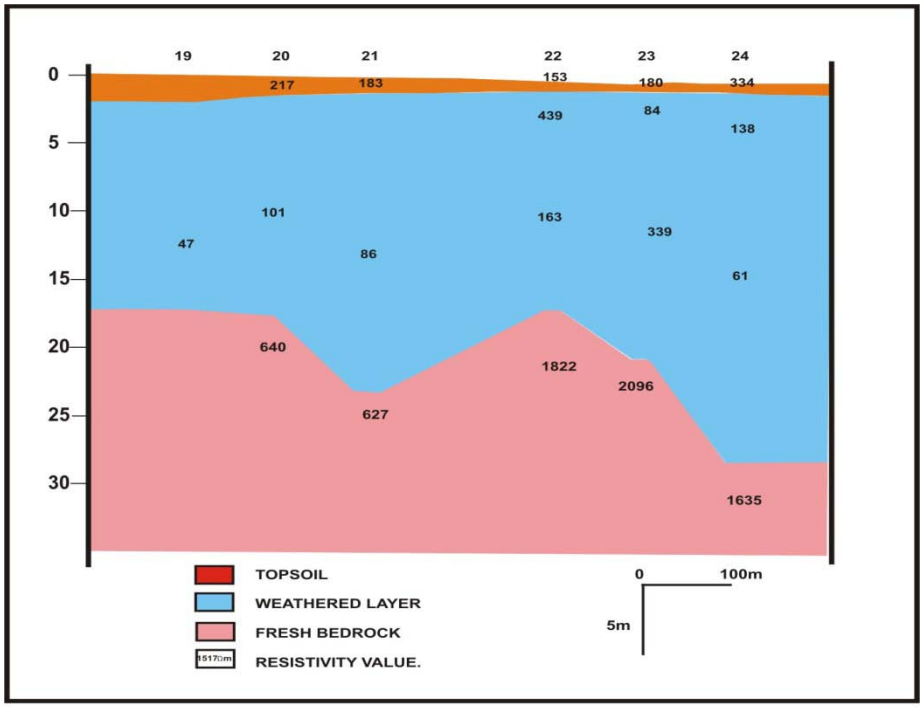

Figure 4c : Geoelectric Section of Along VES 19-24 in Ajebo Area

Also, from the interpreted data, it was observed that the thickness and resistivity value of the aquiferous layers varies from one rock to another. This variation is attributed to the fact that different rocks respond to weathering activities differently. From Both VES and VLF-EM data interpreted results, it was observed that aquiferous layers were encountered at shallower depth in area occupied by Schists than area occupied by Gneiss.

IV. Conclusion

Geological features suspected to be basement fractures identified from VLF- EM anomaly curves were confirmed by geoelectric subsurface images developed from interpretation results of Vertical Electrical Soundings. VLF can detect shallow fracture zones if the weathered layers are not too thick or too conductive like the case of the study areas. The presence of sandy layer in Fig.4a will enhance availability of groundwater. Based on this, area underlay by granite gneiss will be more prolific in term of groundwater exploitation than area underlay by migmatised gneiss. The VLF method can be a tool for detailed groundwater exploration because of its rapid data acquisition, and lower cost than the conventional cumbersome and time- consuming electrical method, particularly in hard-rock terrain. Based on the results obtained from this survey, it can be concluded that the integration of EM profiling and DC Electrical Method together with detailed geological mapping are efficient tools for borehole siting in groundwater exploration in a typical crystalline terrain.

Developing, Searching and Moving Sustainable Through Renewable Technologies

By Abdeen Mustafa Omer
Eri, Nottingham, United Kingdom

Abstract - The use of renewable energy sources is a fundamental factor for a possible energy policy in the future. Taking into account the sustainable character of the majority of renewable energy technologies, they are able to preserve resources and to provide security, diversity of energy supply and services, virtually without environmental impact. This paper outlines possible energy savings and better performance achieved by different solar passive strategies (skylights, roof monitors and clerestory roof windows) and element arrangements across the roof in zones of cold to temperate climates. The aim of this work is to find possible design strategies, and to find solutions to provide thermal and luminous comfort in spaces of intermittent use and a poor aspect or orientation. In regions where heating is important during winter months, the use of top-light solar passive strategies for spaces without an equator-facing façade can efficiently reduce energy consumption for heating, lighting and ventilation.

Developing, Searching and Moving Sustainable Through Renewable Technologies

Abdeen Mustafa Omer

Abstract - The use of renewable energy sources is a fundamental factor for a possible energy policy in the future. Taking into account the sustainable character of the majority of renewable energy technologies, they are able to preserve resources and to provide security, diversity of energy supply and services, virtually without environmental impact. This paper outlines possible energy savings and better performance achieved by different solar passive strategies (skylights, roof monitors and clerestory roof windows) and element arrangements across the roof in zones of cold to temperate climates. The aim of this work is to find possible design strategies, and to find solutions to provide thermal and luminous comfort in spaces of intermittent use and a poor aspect or orientation. In regions where heating is important during winter months, the use of top-light solar passive strategies for spaces without an equator-facing façade can efficiently reduce energy consumption for heating, lighting and ventilation. Passive solar systems for space heating and cooling, as well as passive cooling techniques when used in combination with conventional systems for heating, cooling, ventilation and lighting, can significantly contribute to the energy saving in the buildings sector, and the thermal behaviour of the dependent on the alternatives and interventions made on the building's shell. Exploitation of renewable energy in buildings and agricultural greenhouses can significantly contribute to energy saving. Promoting innovative renewable applications and reinforcing renewable energy market will contribute to preservation of the ecosystem by reducing emissions at local and global levels and will contribute to the amelioration of environmental conditions by replacing conventional resources with renewable sources that produce no air pollution or greenhouse gases and coexist comfortably with existing urban, agricultural and tourist land uses. Sustainable low-carbon energy scenarios for the new century emphasise the untapped potential of renewable resources. Energy efficiency brings health, productivity, safety, comfort and savings to homeowner, as well as local and global environmental benefits.

Keywords : renewable energy sources, technologies, applications, sustainable development.

I. Introduction

Spaces without northerly orientations have an impact on the energy behaviour of a building. For sustainable development, the adverse impacts of energy production and consumption can be mitigated either by reducing consumption, or by increasing the use of renewable or clean energy sources [1]. Bioclimatic design of buildings is one strategy for sustainable development, as it contributes to reducing energy consumption and therefore, ultimately, air pollution and greenhouse gas (GHG) emissions from conventional energy generation. Bioclimatic design involves the application of energy conservation techniques in building construction, and the use of renewable energy such as solar energy and the utilisation of clean fossil fuel technologies.

In the design or refurbishment of buildings to reduce energy consumption, the implementation of passive solar and day-lighting systems may not respond as expected since not all spaces might have a north-facing façade. Spaces without a northerly orientation impact on the energy behaviour of a building in three ways:

- They have reduced availability of daylight,
- Heating in winter due to solar gain will also be reduced, and
- For temperate (mesothermal) climates in summer, solar gain will add to the cooling load.

For buildings with these attributes, to achieve the same energy performance as buildings that benefit from a good orientation and passive solar energy design, air-conditioning/heating is required, thus increasing the total power consumption. To improve the energy performance of a room without a north-facing façade, environmentally sensitive design strategies for lighting, ventilation, cooling or heating can be used depending on the location of the space. Zenithal openings horizontally or vertically glazed, light pipes, light shelves [2], tubular skylights [3] or sun ducts [4] can be used to meet lighting requirements.

To improve the thermal performance, different strategies for indirectly gained solar heat, either through the ceiling or floor, are commonly used (e.g., roof ponds or rock beds). For ventilation, natural forces and passive systems such as solar chimneys can induce air movement or wind towers can have a major beneficial impact on ventilation [5]. Most systems are designed only for one purpose (e.g., lighting, heating or ventilation), and the overall energy performance can potentially be improved in combination with other systems [6]. For example, light pipes or light tubes can be combined with some passive heating strategies (e.g., sun spaces or thermal storage mass on roofs), or solar chimneys for natural ventilation and cooling in warm climates can be combined with day-lighting systems to reduce heat gains, thereby achieving better comfort levels. Skylight, roof monitors and clerestory roof

windows represent a combination of thermal, day-lighting and natural ventilation systems, whereas operable windows are required for natural ventilation. There are several types of spaces that may not possess a suitable northerly aspect or exposure, depending on the location, orientation or connection of that space to the exterior:

- Rooms facing south, east or west.
- In between spaces such as hallways, staircases and attics.
- Spaces where adjacent buildings obstruct north-facing windows.
- Spaces that have problems in lighting, heating, and cooling performance because of poor building design.

The present paper aims with energy using and energy saving technologies in farming, horticulture, livestock production, crop conservation, crop storage, underfloor heating, root zone warming, air knives, supplementary lighting, and energy efficient technologies available to farmers and growers. Examples include slurry treatment, dehumidification, horticultural lighting, and grain drying, environmental control for healthy livestock and heat recovery in combined heat, power and renewable energy sources. Monitoring projects on farms and nurseries, evaluate the costs and performance of new technologies. Computerised design programmes for calculating heating and ventilation requirements in livestock buildings, grain drying systems or lighting in horticultural units, e.g., Venturi aeration of farm waste and disinfection of horticultural waste solutions. Typical applications: making parlour ventilation and fly control, calf pens, poultry houses, pig and sheep units, potato stores, greenhouses, and packing sheds.

The information technology in renewable energy brings with it a set of tools, expertise, in sight and support that may prove invaluable. Specially tools expertise and support in the areas of data and information quality, knowledge management, information dissemination, electronic publishing, networking, data acquisition, management, and control of complex systems, and group-ware. Effective application of these tools give even small and mid-size organisations the ability to manage their products, disseminate their ideas, discover knowledge they require, find project partners, manage projects, acquire data, process and manipulate that data, work on that data with colleagues around the world, lobby politicians, publish results and sell. The technologies required realising an information platform of the scope and nature. Development a technology platform would contain the necessary tools and building blocks with which such an ambitious information management environment could be realised. Very specific requirements within which any such technology platform had to be developed were set right at project inception. These included:

- Modular, extensible architecture.
- Tools for rapid module construction.
- Uniform interface/functionality across modules.
- Full multimedia support.
- High interaction levels.
- Strong information ordering functions.
- Feature-rich application framework.
- Web-based, and fully searchable.
- Sensitivity to future technology trends.

A primary goal of the initiative was to realise, over time, a high level of acceptance and trust from the user community. Several attributes of any information system that could lead to such a level of acceptance were identified. These include:

- Global participation.
- Quality through peer review.
- Author-oriented system.
- Association with the society.
- Broad spectrum of services.
- Easy access to information.
- Good marketing.

For proper rural development the following must be considered:

- Analyse the key potentials and constraints on development of rural energy.
- Assess the socio-technical information needs for decision-makers and planners in rural development.
- Utilise number of techniques and models supporting planning rural energy.
- Design, import and interpret difference types of surveys to collect relevant information and analyse them to be an input to planners.

The unavailability and the acute shortages of the conventional energy supply (petroleum and electricity) to rural people forced them to use alternatives available energy sources like biomass. This situation caused serious environmental degradation beside the poor unsatisfactory services of some basic needs such as:

- Food security.
- Water supply.
- Health care.
- Communication.

In order to raise rural living standards, the per capita energy availability must be increased, through better utilisation of the local available energy resources. It is necessary that a vigorous programme for renewable

energies should be set up (the challenge is to provide a framework enabling markets to evolve along a path that favours environmentally sustainable products and transactions). The use of renewable energy sources is a fundamental factor for a responsible energy policy in the future. Taking into account the sustainable character of the majority of renewable energy technologies, they are able to preserve resources and to provide security, diversity of energy supply and services, virtually without environmental impact. A reliable strategy has potential benefits for research and technology development:

- It contributes to the development of new solar applications, expanding their use and offering to enterprise ways to improve their competitiveness, productivity and their position in the market.
- It stimulates the renewable energy market by improving reliability, durability, efficiency, and competitiveness.
- Dissemination of the appropriate information will raise public awareness on environmental problems and at the save time will emphasise on the role of renewable energy technologies as a reliable, clean and environmentally friendly solution, thus enhancing its social acceptance.
- Will contribute to the improvement of the quality of the life by promoting an environmentally clean and innovative technology.
- Will, via collaboration among partners from different countries and regions, allow the establishment of continuing working relations, create new links, improve ways of communications and remove technical and non-technical barriers.

With environmental protection posing as the number one global problem, man has no choice but to reduce his energy consumption. One way to accomplish this is to resort to passive and low-energy systems to maintain thermal comfort in buildings. The conventional and modern designs of wind towers can successfully be used in hot arid regions to maintain thermal comfort (with or without the use of ceiling fans) during all hours of the cooling season, or a fraction of it. Climatic design is one of the best approaches to reduce the energy cost in buildings. Proper design is the first step of defence against the stress of the climate. Buildings should be designed according to the climate of the site, reducing the need for mechanical heating or cooling. Hence maximum natural energy can be used for creating a pleasant environment inside the built envelope. Technology and industry progress in the last decade diffused electronic and informatics' devices in many human activities, and also in building construction. The utilisation and operating opportunities components, increase the reduction of heat losses by varying the thermal insulation, optimise the lighting distribution with louver screens and operate mechanical ventilation for coolness in indoor spaces. In addition to these parameters the intelligent envelope can act for security control and became an important part of the building domotic revolution. Application of simple passive cooling measure is effective in reducing the cooling load of buildings in hot and humid climates. Forty-three percent reductions can be achieved using a combination of well-established technologies such as glazing, shading, insulation, and natural ventilation. More advanced passive cooling techniques such as roof pond, dynamic insulation, and evaporative water jacket need to be considered more closely. The building sector is a major consumer of both energy and materials worldwide, and that consumption is increasing.

Most industrialised countries are in addition becoming more and more dependent on external supplies of conventional energy carriers, i.e., fossil fuels. Energy for heating and cooling can be replaced by new renewable energy sources. New renewable energy sources, however, are usually not economically feasible compared with the traditional carriers. In order to achieve the major changes needed to alleviate the environmental impacts of the building sector, it is necessary to change and develop both the processes in the industry itself, and to build a favourable framework to overcome the present economic, regulatory and institutional barriers. This article describes various designs of low-energy buildings. It also, outlines the effect of dense urban building nature on energy consumption, and its contribution to climate change. Measure, which would help to save energy in buildings, is also presented.

II. Methods of Expressing Concentration

The methods of expressing the concentration of a constituent of a liquid or gas are:

1) Mass/volume: The mass of solute per unit volume of solution (in water chemistry). This is analogous to weight per unit volume, typically, mg/L = ppm (parts per million).
2) Mass/mass or weight/weight: The mass of a solute in a given mass of solution, typically, mg/kg or ppm (parts per million).

If the density of a solution = ρ = mass of solution/volume of solution (kg/L) and, concentration of a constituent in mg/L = CA1 = mass of constituent/volume of solution (mg/L), and, concentration of a constituent in ppm = CA2 = mass of constituent/mass of solution (mg/kg).
Then rearranging,
ρ = CA1/CA2.

$$\text{If } \rho = 1\text{kg/L; then CA1} = \text{CA2}, \quad (1)$$

i.e., the concentration of a constituent in ppm mg/kg = concentration of a constituent in mg/L.

For most applications in water and wastewater environments, ρ = 1kg/L. For applications in the air environment, Eq. (1) does not hold. The use of mg/L is most common in water applications as the volume of the solution is usually determined as well as the mass of the solute. The unit ppm is typically used in sludges or sediments. To prove the portable of transmutation of pollutants, experimental investigations may be conducted to bombard C or CO_2 or CH_4 or other air pollutants by accelerated alpha particles in a low-pressure vacuum tube in a similar condition of ionosphere. Heating them with gamma radiation can accelerate the alpha particles. The results of such experimental investigation may prove the probable transmutation of pollutants and self-sustaining equilibrium of the global environment [6].

III. Particles

Particle contamination of evaporative cooling loops can be created by an entry, make-up water, and corrosion by-products and precipitated mineral development. According to the ASHARE guidelines, when legionella are present in aquatic environment, there are multiple factors that control the risk of infection such as:

- Conditions favourable for amplification of the organism
- A mechanism of dissemination
- Inoculation of the organism at a site where it is capable of causing infection
- Bacterial strain-specific virulence factors
- The susceptibility of the host

Table 1 representing of one billion particles in a range of sizes, shows that even a relatively small number of particles 10-75 microns in size can represent a very large volume of particles.

Table 1 : Particle size vs volume

Size of particle (micron)	Quantity of particle (billion particles)	Total volume (Cm^3)
5	212.5	14.58
3	212.5	3.11
1	212.5	0.11
0.45	212.5	0.0089
Sub-total	850	17.83
10	37.5	21.30
25	37.5	303.16
50	37.5	2459.70
75	37.5	8260.72
Sub-total	150	11044.88

IV. Need of Ventilation With energy Recovery in Cold Stores

Table 2 present solutions for proper ventilation with energy recover. CO_2 accumulation – respiration is a basic biological process which occurs in living body to provide it energy to live, as all the fruits and vegetables are living so they carry out respiration. The respiration can be explained by following reaction;

$$C_6H_{12}O_6 + 6\ O_2 \rightarrow 6\ CO_2 + 6\ H_2O + \text{energy (heat)} \quad (2)$$

Table 2 : Size of the equipment

Capacity of cold storage	5000 Mt
Number of chambers and capacity	4 x 1250 Mt
Size of cold storage chambers	21.00 m x 16.00 m x 13.70 m (L x W x H)
Ventilation requirements	2-6 air changes per day
Volume of cold storage	4603 m^3 or 162400 ft^3
Fresh air required for CA	677 cfm
Total fresh air required for chambers	677 x 4 = 2708 cfm

CA Controlled atmosphere
cfm Cubic feet minute

A large number of the phase-change materials (PCMs) are available in any required temperature range. Within the human comfort range of 25-30°C, some PCMs are very effective (*Table 3*).

Table 3 : A phase-change materials (PCMs) for building insulation

PCMs	Type	Melting point (°C)	L atent heat (kJ/kg)
45% Ca $(NO_3)_2.6H_2O$+55% $Zn(NO_3)_2.6H_2O$	Mixture	25	130

The coefficient of performance (COP) is the ratio between useful energy acquired and energy applied and can be expressed as:

$$COP = Hu/Ha \quad (3)$$

Hu is the useful energy acquired (Btu)

Ha is the energy applied (Btu)

V. Energy Efficient Water Cooler

It is observed that modified water cooler with the facility to use of waste water along with the tap water for condenser cooling performs better in comparison to conventional water cooler. Almost 44% COP improvement is observed due to reduction in power consumption (*Figure 1*). Typical results comparing COP and power consumed are shown in *Table 4. Table 5* Energy consumption and corresponding expenses occurred.

Table 4 : Performance parameter comparison

Item	Air cooled condenser	Water cooled condenser without use of waste water	Water cooled condenser with use of waste water
COP	2.5274	3.2248	3.6278
Power consumed (kW)	0.52	0.3541	0.3254

Table 5 : Energy consumption and corresponding expenses occurred

Item	Per day	Per day	Per month	Per month	Per year	Per year
Water cooler system	Energy (W)	Expenditure ($)	Energy (W)	Expenditure ($)	Energy (W)	Expenditure ($)
Conventional water cooler with air cooled condenser	4.6	19.32	138	743.4	1656	8920.8
Modified water cooler with water cooled condenser	3.94	16.55	118.2	658.26	1418.4	7899.12

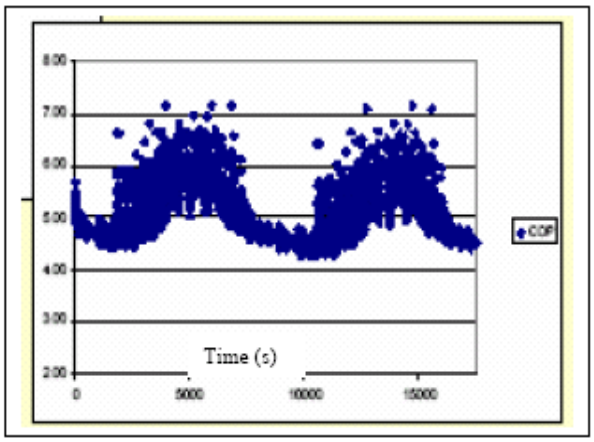

Figure 1 : Coefficient of Performance (COP)

This theme presents the study of energy efficiency improvements of water pumping systems refrigeration and air conditioning plants (R&AC). Pumps account for nearly 13-20% of electrical power and 22-30% of the electrical energy input of R&AC plants. *Table 6* gives the acceptable pump, motor and overall (composite pump – motor) efficiencies.

Table 7 gives the recommended practices to ensure that efficiency does not deterioration with operating period. The beginning of pump deterioration starts with balance operating point (BP) deviating away from the best efficiency point (BEP) resulting in creation of unbalanced forces and vibrations *(Figure 2). Table 8* gives the requirements for choice of pumps.

Table 6 : Guidance valves for overall efficiency of pump-motor sets

Electric rating (kW)	Motor efficiency (%)	Pump efficiency (%)	Overall efficiency (pump+motor)(%)	Margin in active power (%)
<10	90	80	72	20
10-20	92	85	78	15
20-30	93	85	79	15
30-50	94	85	80	15
50-100	95	85	81	10
>100	96	85	62	10

Table 7 : Recommended operation and maintenance (O&M) practices for pumps

Particular	Details
Timber	Number of hours clocked, time between repairs, frequency of repairs must be recorded. This information in itself is a good diagnostic tool. Can be used as a basis for life cycle costing in future.
Condition monitoring	Bearing and winding temperatures and bearing vibrations are diagnostic in predicting failures.
Planned maintenance schedules after 1 k, 4 k and 8 k hours	Strict adherence including recording of observations/ documentation of observations is a good diagnostic tool. Many of time valuable information about the equipment is known only to the technical and does not get translated into management information.
Root cause analysis	Shaft misalignment, unbalanced forces, off the best efficiency point (BEP) operation, filter clogging can lead to other problems like seal leaks, bearing failures, motor burn out, etc. It is very important to understand root cause of a failure or else it will occur again and again in different forms.
Periodic shaft alignment	Radial shaft alignment must be below 0.06 mm. Angular shaft alignment must be below 0.5°C.
Impeller and casing wear ring clearance measurement	Must be measured when the impeller is opened. It must not be over 0.0025 mm beyond factory setting. Typical factory clearance is 0.20-0.24 mm.

The heating or cooling of a space to maintain thermal comfort is a highly energy intensive process accounting for as much as 60-70% of total energy use in non-industrial buildings. Of this, approximately 30-50% is lost through ventilation and air infiltration. However, estimation of energy impact of ventilation relies on detailed knowledge about air change rate and the difference in enthalpy between the incoming and outgoing air streams. In practice, this is a difficult exercise to undertake since there is much uncertainty about the value of these parameters [7]. As a result, a suitable datum from which strategic planning for improving the energy efficiency of ventilation can be developed has proved difficult to establish [8]. Efforts to overcome these difficulties are progressing in the following two ways:

- Identifying ventilation rates in a representative cross section of buildings.
- The energy impact of air change in both commercial and domestic buildings.

The challenge before many cities today is to support large numbers of people while limiting their impact on the natural environment. Buildings in a modern society are significant users of energy and materials and, hence, energy conservation in buildings plays an important role in urban environmental sustainability. A challenging task for architects and other building professionals, therefore, is to design and promote low energy buildings in a cost effective and environmentally responsive way. Passive and low energy architecture has been proposed and investigated in different locations around the world, and design guides and handbooks have been produced for promoting energy efficient buildings.

Table 8 : Specifications/requirements for procurement of energy efficient pumps

Particular	Details
Duty point	The duty point of the pump must be specified by providing the suction head (pressure, velocity, elevation) and discharge head (pressure, velocity, elevation) based on actual measurements and not on assumed data.
Best efficiency point (BEP)	BEP flow rate must coincide with duty point or balance point flow rate. The balance point is the flow rate point at which the pressure rise of the pump coincides with the pressure drop of the circuit.
Minimum efficiency	Minimum efficiency must be specified as per guidance values.
Range of applicability of minimum efficiency	The minimum efficiency must be applicable for a change in total head of + 10% and -25%.
Testing of the pump	Pump must be tested and witnessed by owner personnel.
Seal life	Seal life of 24 months from date of commissioning.
Bearing life	Bearing life of 36 months from date of commissioning.
Mean time between failure (MTBF) = [Total time period x number of failures in the time period]	Guarantee MTB may be specified as 40,000 hours for the impeller and motor.
Performance guarantee at site	The vendor must demonstrate the energy efficiency through measurement performance guarantee test (PG test).

VI. Natural Ventilation

Generally, buildings should be designed with controllable natural ventilation. A very high range of natural ventilation rates is necessary so that the heat transfer rate between inside and outside can be selected to suit conditions [*9*]. The ventilation rates required to control summertime temperatures are very much higher than these required to control pollution or odour. Any natural ventilation system that can control summer temperatures can readily provide adequate ventilation to control levels of odour and carbon dioxide production in a building. Theoretically, it is not possible to achieve heat transfer without momentum transfer and loss of pressure. Such ideas work well for small buildings.

VII. Mechanical Ventilation

Most of the medium and large size buildings are ventilated by mechanical systems designed to bring in outside air, filter it, supply it to the occupants and then exhaust an approximately equal amount of stale air. Ideally, these systems should be based on criteria that can be established at the design stage. To return afterwards in attempts to mitigate problems may lead to considerable expense and energy waste, and may not be entirely successful [*10*]. The key factors that must be included in the design of ventilation systems are: code requirement and other regulations or standards (e.g., fire), ventilation strategy and systems sizing, climate and weather variations, air distribution, diffuser location and local ventilation, ease of operation and maintenance and impact of system on occupants (e.g., acoustically). These factors differ for various building types and occupancy patterns. For example, in office buildings, pollutants tend to come from sources such as occupancy, office equipment, and automobile fumes. Occupant pollutants typically include metabolic carbon dioxide emission, odours and sometimes smoking. When occupants (and not smoking) are the prime source. Carbon dioxide acts as a surrogate and can be used to cost-effectively modulate the ventilation, forming what is known as a demand controlled ventilation system. Generally, contaminant sources are varied but, often, well-defined and limiting values are often determined by occupational standards.

It may mean achieving zero energy requirements for a house or reduced energy consumption in an office building. However, a major goal of low energy building projects and studies is usually to minimize the amount of externally purchased energy, such as electricity and fuel gas. Sometimes the target may focus on the energy costs or a particular form of energy input to the building.

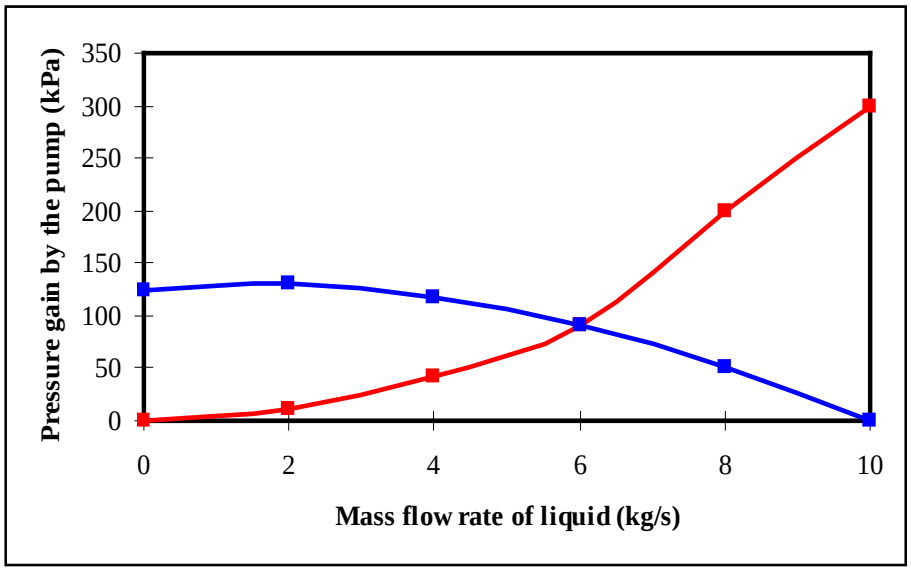

Figure 2 : Balance point (BP) of the pump must coincide with the best efficiency point (BEP)

Passive solar systems for space heating and cooling, as well as passive cooling techniques can significantly contribute to energy saving in the building sector when used in combination with conventional systems for heating, cooling, ventilation and lighting. The overall thermal behaviour of the building is dependent on the alternatives and interventions made on the building's shell. Passive ventilation systems share the use of renewable energy to provide ventilation with infiltration. But unlike air leakage and open windows, passive ventilation systems are designed to provide specific amounts of ventilation to minimise both energy liabilities due to excessive ventilation and periods of poor air quality due to under-ventilation [*11*]. However, the most common passive ventilation system is the passive stack, which is normally used to extract air from kitchen and bathrooms. In this method, prevailing wind and temperature differences are used to drive airflow through a vertical shaft. Various stack designs can be used to control or enhance the performance, based on local climate. However, careful design is required to avoid backdraughting and to insure proper mean rates. Although there is significant experience with this approach in Europe, it has been rarely used in North America [*12*]. Well-designed passive ventilation systems can be used to provide whole-building ventilation as well as local exhaust. Some efforts are currently underway to develop passive ventilation systems that incorporate heat recovery to minimise the need for conditioning the ventilation air [*13*]. These approaches aim towards a fully renewable ventilation system in that it requires no non-renewable resources for either providing the ventilation air or conditioning it. *Table 9* shows natural ventilation vs mechanical ventilation.

An expression for the airflow induced by the stack effect is:

$$Qstack = Cd*A*[2gh\ (Ti-To)/Ti]^{1/2} \quad (4)$$

Where:

Qstack is the volume of ventilation rate (m^3/s)

Cd is a discharge coefficient (0.65)

A is a free area of inlet opening (m^2), which equals area of outlet opening

g is the acceleration due to gravity (9.8 m/s^2)

h is the vertical distance between inlet and outlet midpoints (m)

Ti is an average temperature of indoor air (K), note $27^oC = 300$ K

To is an average temperature of outdoor air (k)

However, as building design needs to consider requirements and constraints, such as architectural functions, indoor environmental conditions, and economic effectiveness, a pragmatic goal of low energy building is also to achieve the highest energy efficiency, which requires the lowest possible need for energy within the economic limits of reason. Therefore, since many complicated factors and phenomena influence energy consumption in buildings, it is not easy to define low energy building precisely or to measure and compare the levels of building energy performance. The loose fit between form and performance in architectural design also makes quantitative analysis of building energy use more difficult.

Table 9 : Natural ventilations Vs mechanical ventilation

Natural ventilation	Mechanical ventilation
Natural ventilation regulates the indoor climate by a controlled air flow through the windows. Compared to mechanical ventilation natural ventilation uses only a small amount of energy when the windows open and close. A head to head comparison shows that natural ventilation has 40% lower CO" emission than a system with mechanical ventilation.	Effective solution when building geometry prevents natural ventilation solution or scheme design requires set ventilation rate.
Reduced capital, space and running costs compared to conventional air conditioning.	
Potential for integrated day-to-day and smoke control as well as hybrid natural and mechanical ventilation systems.	Potential for integrated day-to-day and smoke control as well as hybrid natural and mechanical ventilation systems.
Custom solutions for all types of buildings.	
Total support from design, installation, through to service and maintenance.	Total support from design, installation, through to service and maintenance.
Energy-efficient and cost-effective	A particularly important aspect of mechanical ventilation is having heat recovery, which allows incoming air to be warmed by outgoing air through a heat exchanger, therefore avoiding heat loss through the ventilation system.

VIII. Refrigeration

If temperature of hot gas is too high, the tendency of coil is to steam. Also, as the air temperature goes, its relative humidity drops. This leads to increased evaporation of surface water. It also, adds to refrigeration load if it is a cold storage or if the freezers are in the open area then it leads to fog/mist formation. Warmer temperatures will not necessarily improve defrost efficiency. This is because most of the defrost heat comes from latent heat of hot gas, rather than sensible heat (*Table 10*).

Table 10 : Ammonia Refrigerant

Temperature (°C)	Pressure (Bar)	Latent heat (kJ/kg)
4	4	1240
10	5	1220
16	6	1200
21	8	1180

After the corrective actions taken by Montreal protocol and subsequent Kyoto protocol, in recent years, the consumption of potential greenhouse gases has increased, whist at the same time the consumption of CFCs, HCFCs and other substances, which are depleting the ozone layer, is approaching zero.

Refrigerants are identified by number, preceded by the letter ''R'' designation has been established by ASHRAE and is used throughout the industry. Common refrigerants are listed in *Table 11* along with their chemical name and the ODP. The prefix ''CFC' refers to the family of refrigerants containing chlorine, fluorine and carbon. Compounds that also contain hydrogen precede the abbreviation with the letter ''H'' to signify an increased deterioration potential before reaching the preceded with an ''H'' as in 'HFC''.

Table 11 : Characteristics of some common refrigerants

R Number	Chemical type	ODP	Similar to	comments
Rr-11	CFC	1.00		11
R-12	CFC	1.00		12
R-22	HCFC	0.05		22
R-123	HCFC	0.02		123
R-134a	HFC	0.00		Single
R-401a	HCFC	0.05	R-12	22, 152a, 124
R-402b	HCFC	0.02	R-12	125, 290, 22

Table 12 summarises the overall impact of the three refrigerants with respect to R-22 performance. It is based on information from system tests. There is high potential for significant material and labour savings for air conditioning systems with R - 410 A refrigerant *Table 13*).

Table 12 : Performance comparison for alternate refrigerants

Efficient effect (%) relative to R-22	R-134a	R-407C	R-410A
Thermodynamics	3	-4	-7
Compressor	-3	-1	5
Heat exchanger	-6	-2	2
Lines	-2	0	2
Total (net)	-9	-7	5

Table 13 : Characteristics of some substance refrigerants

Substance	R-number	Chemical formula	ODP value	GWP value
HCFC-22	R-22	CHF2Cl	0.005	1700
HFC-134a	R-134a	CH_2FCF_3	0	1300
HFC-407C	R-407C	CH_2F_2, CF_3CHF_2, CH_2FCF_3	0	1526
HFC-410A	R-410A	CH_2F_2, CHF_2CF_3	0	1725

The input data required are the following:

- Thermal gains related data: solar protection is assumed good, thermal gains can be varied and the user specifies the occupancy period.
- Building fabric data: glazing ratio can be any value while thermal mass can be varied at three levels.
- Ventilation data: infiltration, day ventilation and night ventilation can be specified as necessary.
- Weather data: solar data are fixed but temperature is user specified for seven days although temperature profiles need not be the same for all days. The weather data are specified in the form of maximum and minimum temperature for each day and hourly values are calculated by sinusoidal fitting.

However, a primary strategy for cooling buildings without mechanical intervention in hot humid climates is to promote natural ventilation. To control the energy used for the cooling of buildings in hot-arid regions with ambient air temperatures during the hottest period between 42 to 47°C, passive cooling approaches should be implemented [*14*]. A solar chimney that employs convective currents to draw air out of the building could be used. By creating a hot zone with an exterior outlet, air can be drawn into the house, ventilating the structure as well as the occupants. Since solar energy in such a region is immense, the hot zone created with a black metal sheet on the glazing element can draw hotter air at a slightly higher speed [*15*]. Applications of solar chimneys in buildings were limited to external walls. Integrating a solar chimney with an evaporatively cooled cavity could result in a better cooling effect. However, this should be applied with care since water sources are limited [*16*]. Average room and ambient air temperatures are 23 and 27°C respectively. Air velocity required to achieve thermal comfort in the room should reach a maximum of 0.3 m/s [*17*].

IX. Air Pollutants and Transmutation

Controlling the pollution of the present civilisation is in an increasing concern. More importance is given to control global carbon dioxide, which is considered to be the main factor of green house effect. Though the complete experimental result on the fact is yet to be debated, the immense heat, temperature and turbulence of nuclear explosion oxidising the atmospheric nitrogen into nitric oxide, are considered to be similarly responsible for depletion of ozone layer [*18*]. At present, more importance is given for plantation to reduce the level of global carbon dioxide. The plantation over the whole earth surface may control only 50% of carbon dioxide disposed to atmosphere and its greenhouse effect. There are, also, explosions in the ozone layer time to time to add to the problem. Irrespective of the relative importance of each factor, the ozone layer protects us from harmful cosmic radiations and it is believed that the depletion of ozone layer increases the threat of outer radiations to human habitation if environmental pollution is not controlled or there is no possibility of self-sustainable stability in nature [*19*].

The presence of ionosphere in the outer-sphere is most probably for ionic dissociation of the gases of the outer-sphere in the presence of low pressure and cosmic radiation [*20*]. Moreover the ionosphere contains charged helium ions (alpha particle). Therefore, it may

be concluded that the explosion in the ozone and transmission of radiations through it are the possible effects of transmutation of pollutants with exothermic reaction (emission of radiations) [*21*]. The existence of a black hole in the space, which is found in the photo camera of astrologist, is still unexplored. This black hole may be an effect of transmutation process with absorption of heat energy (endothermic reaction). The idea of transmutation of pollutants has been proposed for one or more of the following reasons:

- The experimental results support the transmutation of materials.
- To search the sinks of the remaining carbon dioxide not absorbed by plants or seawater.
- To find out the possible causes of explosion in the ozone layer other than the depletion of ozone layer.
- To investigate the possibilities of the self-sustaining stability of global environment.

To prove the portable of transmutation of pollutants, experimental investigations may be conducted to bombard C or CO_2 or CH_4 or other air pollutants by accelerated alpha particles in a low-pressure vacuum tube in a similar condition of ionosphere. Heating them with gamma radiation can accelerate the alpha particles. The results of such experimental investigation may prove the probable transmutation of pollutants and self-sustaining equilibrium of the global environment [*22*].

X. Energy and Environment

Today, renewable energy is some 20% of the world's annual energy use of about 9 x 10^9 tonnes of oil equivalent (Mtoe/a; 1 toe = 42 GJ) [*23*]. Fossil fuels account for the bulk; about 80% of the energy use. In the future, it is postulated that these roles will change as energy demand rises and cheap oil and gas are depleted; even without consideration of global warming effects. The changes will be driven mainly by the developing areas, which have relatively less of the fossil fuel reserves, but have a substantial potential to deploy renewable energies [*24*]. A substantial potential is believed to exist in the world for renewable energy sources. This is estimated as 4900 Mtoe/a for biomass, 780 Mtoe/a (electric) for hydropower, and 4540 Mtoe/a (electric) for wind-power [*25*]. Roughly half of these energy resources are in developing countries. The rest of the energy will have to be supplied by fossil, solar, geothermal and nuclear (fission and fusion) sources. An example distribution of world energy sources is shown in *Figure 3.*

They are campaigning for sustainable development, which has been defined as development, which meets present needs without compromising the ability of future generation to meet their needs [*26*].

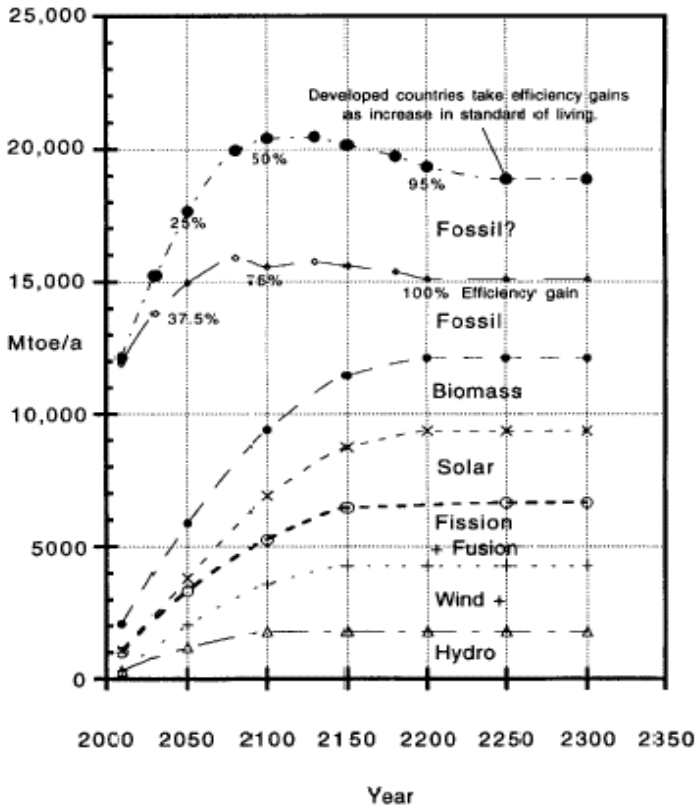

Figure 3 : Total energy uses for 2010-2300 with potential energy sources (added to give total)
(a) Lower efficiency and developed countries take efficiency gains as increase in standard of living.
(b) Higher efficiency gains and developed countries use gains to reduce energy use.

It is, therefore, essential that energy efficiency improvements and all energy sources, particularly renewables, are developed and deployed rapidly in order to ensure that population stabilisation, with a decent standard of living for all, is realised. There is a need to move towards a sustainable energy policy with the objectives of environmental protection, sound natural resource management and energy security [27]. Opportunities exist for the increased development of renewable energy and energy efficiency through regulation, changes to institutional and economic arrangements, and through liberalisation of the energy market, which offers the potential for the development of energy service companies and a market for green electricity. Friends of the Earth have been one of the leading environmental groups campaigning in support of renewable energy and energy efficiency over the last two decades.

Industry's use of fossil fuels has been blamed for our warming climate. When coal, gas and oil are burnt, they release harmful gases, which trap heat in the atmosphere and cause global warming. However, there has been an ongoing debate on this subject, as scientists have struggled to distinguish between changes, which are human induced, and those, which could be put down to natural climate variability. Industrialised countries have the highest emission levels, and must shoulder the greatest responsibility for global warming. However, action must also be taken by developing countries to avoid future increases in emission levels as their economies develop and population grows. Human activities that emit carbon dioxide (CO_2), the most significant contributor to potential climate change, occur primarily from fossil fuel production. Consequently, efforts to control CO_2 emissions could have serious, negative consequences for economic growth, employment, investment, trade and the standard of living of individuals everywhere. Scientifically, it is difficult to predict the relationship between global temperature and greenhouse gas concentrations. The climate system contains many processes that will change if warming occurs. Critical processes include heat transfer by winds and currents, the hydrological cycle involving evaporation, precipitation, runoff and groundwater and the formation of clouds, snow, and ice, all of which display enormous natural variability. The equipment and infrastructure for energy supply and use are designed with long lifetimes, and the premature turnover of capital stock involves significant costs. Economic benefits occur if capital stock is replaced with more efficient equipment in step with its normal replacement cycle. Likewise, if opportunities to reduce future emissions are taken in a timely manner, they should be less costly. Such flexible approaches would allow society to take account of evolving scientific and technological knowledge, and to gain experience in designing policies to address climate change.

XI. Renewable Energy

The energy conservation scenarios include rational use of energy policies in all economy sectors and use of combined heat and power systems, which are able to add to energy savings from the autonomous power plants. Electricity from renewable energy sources is by definition the environmental green product. Hence, a renewable energy certificate system is an essential basis for all policy systems, independent of the renewable energy support scheme. It is, therefore, important that all parties involved support the renewable energy certificate system in place. The potential of the most important forms of renewable energy, such as solar, wind, biomass, and geothermal energies, is shown in *Table 14*. Existing renewable energy technologies could play a significant mitigating role, but the economic and political climate will have to change first. Climate change is real. It is happening now, and greenhouse gases produced by human activities are significantly contributing to it. The predicted global temperature increase of between 1.5 and 4.5 degrees C could lead to potentially catastrophic environmental impacts.

Table 14 : Potential, productive, end-uses of various energy sources and technologies

technology	Productive end-uses and commercial activities
Solar	Lighting, water pumping, radio, TV, battery charging, refrigerators, cookers, Dryers, cold stores for vegetables and fruits, water desalination, heaters, baking, etc.
Wind	Pumping water, grinding and provision of power for small industries
Hydro	Lighting, battery charging, food processing, irrigation, heating, cooling, cooking, etc.
Biomass	Sugar processing, food processing, water pumping, domestic use, power Machinery, weaving, harvesting, sowing, etc.
Kerosene	Lighting, ignition fires, cooking, etc.
Dry cell batteries	Lighting, small appliances
Diesel	Water pumping, irrigation, lighting, food processing, electricity generation,
	Battery charging, etc.
Animal and human power	Transport, land preparation for farming, food preparation (threshing)

In order to meet challenges, the future energy policies should put more emphasis on developing the potential of energy sources, which should form the foundation of future global energy structure [*28*]. The concept of an integrated renewable energy farm (IREF) is a farming system model with optional energetic autonomy, which includes food production and if possible, energy exports. Energy production and consumption at the IREF have to be environmentally friendly, sustainable and eventually based mainly on renewable energy sources. A combination of different possibilities exists for non-polluting energy production, such as modern wind and solar electricity production, as well as the production of energy from biomass. An IREF system based largely on renewable energy sources would seek to optimise energetic autonomy and an ecologically semi-closed system while also providing socio-economic viability and giving due consideration to the newest concept of landscape and bio-diversity management. Ideally, it would promote the integration of different renewable energies and rural development, as well as contributing to the reduction of greenhouse gas emission as shown in *Table 15.* The overall objective is that the IREF concept be successfully introduced into agricultural production systems, which have to be completely sustainable, taking into account the following influential factors [*29-30*]:

- Impact, influence and needs of climate, soil and crops.
- Ratio of required food/bio-fuel production.
- Input/output requirement for cultivation, energy balance and output/input ratio.
- Equipment choices (wind, solar, biomass generation and conversion technology).

Table 15 : The possible shares of different renewable energies in diverse climatic zones produced on an energy farm

Climatic Region	Energy source	Power production (% of total need)	Heat production (% of the total need)	Biomass need (total area)	Biomass area (5 of the total area)
Northern and Central Europe	Solar 200 m^2 Wind 100 kW Biomass	7 100 100	15 - 105	60	12
South Europe	Solar 250 m^2 Wind 100 kW Biomass	12.7 100 70	40 - 65	36	48
Northern Africa Sahara	Solar 300 m^2 Wind 100 kW Biomass	21 75 25	90 - 29	14	1.2
Equatorial Region	Solar 200 m^2 Wind 100 kW Biomass	18.2 45 70	37.5 - 80	45	

XII. Conclusions

Many cities around the world are facing the problem of increasing urban density and energy demand. As cities represent a significant source of growth in global energy demand, their energy use, associated environmental impacts, and demand for transport services create great pressure to global energy resources. Low energy design of urban environment and buildings in densely populated areas requires consideration of a wide range of factors, including urban setting, transport planning, energy system design, and architectural and engineering details. It is found that densification of towns could have both positive and negative effects on the total energy demand. With suitable urban and building design details, population should and could be accommodated with minimum worsening of the environmental quality.

Energy efficiency brings health, productivity, safety, comfort and savings to homeowners, as well as local and global environmental benefits. The use of renewable energy resources could play an important role in this context, especially with regard to responsible and sustainable development. It represents an excellent opportunity to offer a higher standard of living to local people and will save local and regional resources. Implementation of greenhouses offers a chance for maintenance and repair services. It is expected that the pace of implementation will increase and the quality of work improve in addition to building the capacity of the private and district staff in contracting procedures. The financial accountability is important and should be made transparent.

Global Journals Inc. (US) Guidelines Handbook 2013

www.GlobalJournals.org

FELLOW OF ASSOCIATION OF RESEARCH SOCIETY IN HUMAN SCIENCE (FARSHS)

- FARSHS' title will be awarded to the person after approval of Editor-in-Chief and Editorial Board. The title 'FARSHS" can be added to name in the following manner. eg. Dr. John E. Hall, Ph.D., FARSHS or William Walldroff Ph. D., M.S., FARSHS
- Being FARSHS is a respectful honor. It authenticates your research activities. After becoming FARSHS, you can use 'FARSHS' title as you use your degree in suffix of your name. This will definitely will enhance and add up your name. You can use it on your Career Counseling Materials/CV/Resume/Visiting Card/Name Plate etc.
- 60% Discount will be provided to FARSHS members for publishing research papers in Global Journals Inc., if our Editorial Board and Peer Reviewers accept the paper. For the life time, if you are author/co-author of any paper bill sent to you will automatically be discounted one by 60%
- FARSHS will be given a renowned, secure, free professional email address with 100 GB of space eg.johnhall@globaljournals.org. You will be facilitated with Webmail, SpamAssassin, Email Forwarders, Auto-Responders, Email Delivery Route tracing, etc.
- FARSHS member is eligible to become paid peer reviewer at Global Journals Inc. to earn up to 15% of realized author charges taken from author of respective paper. After reviewing 5 or more papers you can request to transfer the amount to your bank account or to your PayPal account.
- Eg. If we had taken 420 USD from author, we can send 63 USD to your account.
- FARSHS member can apply for free approval, grading and certification of some of their Educational and Institutional Degrees from Global Journals Inc. (US) and Open Association of Research,Society U.S.A.
- After you are FARSHS. You can send us scanned copy of all of your documents. We will verify, grade and certify them within a month. It will be based on your academic records, quality of research papers published by you, and 50 more criteria. This is beneficial for your job interviews as recruiting organization need not just rely on you for authenticity and your unknown qualities, you would have authentic ranks of all of your documents. Our scale is unique worldwide.

- FARSHS member can proceed to get benefits of free research podcasting in Global Research Radio with their research documents, slides and online movies.
- After your publication anywhere in the world, you can upload you research paper with your recorded voice or you can use our professional RJs to record your paper their voice. We can also stream your conference videos and display your slides online.
- FARSHS will be eligible for free application of Standardization of their Researches by Open Scientific Standards. Standardization is next step and level after publishing in a journal. A team of research and professional will work with you to take your research to its next level, which is worldwide open standardization.
- FARSHS is eligible to earn from their researches: While publishing his paper with Global Journals Inc. (US), FARSHS can decide whether he/she would like to publish his/her research in closed manner. When readers will buy that individual research paper for reading, 80% of its earning by Global Journals Inc. (US) will be transferred to FARSHS member's bank account after certain threshold balance. There is no time limit for collection. FARSHS member can decide its price and we can help in decision.

MEMBER OF ASSOCIATION OF RESEARCH SOCIETY IN HUMAN SCIENCE (MARSHS)

- MARSHS title will be awarded to the person/institution after approval of Editor-in-Chef and Editorial Board. The title 'MARSHS' can be added to name in the following manner: eg. Dr. Thomas Knoll, Ph.D., MARSHS
- MARSHS can submit one paper every year for publication without any charges. The paper will be sent to two peer reviewers. The paper will be published after the acceptance of peer reviewers and Editorial Board.
- Free 2GB Web-space will be allotted to 'MARSHS' along with sub Domain to contribute and participate in our activities.
- A professional email address will be allotted with free 1GB email space.
- MARSHS will be authorized to receive e-Journal GJHSS for lifetime.

AUXILIARY MEMBERSHIPS

ANNUAL MEMBER

- Annual Member will be authorized to receive e-Journal GJHSS for one year (subscription for one year).
- The member will be allotted free 1 GB Web-space along with subDomain to contribute and participate in our activities.
- A professional email address will be allotted free 500 MB email space.

PAPER PUBLICATION

- The members can publish paper once. The paper will be sent to two-peer reviewer. The paper will be published after the acceptance of peer reviewers and Editorial Board.

Process of submission of Research Paper

The Area or field of specialization may or may not be of any category as mentioned in 'Scope of Journal' menu of the GlobalJournals.org website. There are 37 Research Journal categorized with Six parental Journals GJCST, GJMR, GJRE, GJMBR, GJSFR, GJHSS. For Authors should prefer the mentioned categories. There are three widely used systems UDC, DDC and LCC. The details are available as 'Knowledge Abstract' at Home page. The major advantage of this coding is that, the research work will be exposed to and shared with all over the world as we are being abstracted and indexed worldwide.

The paper should be in proper format. The format can be downloaded from first page of 'Author Guideline' Menu. The Author is expected to follow the general rules as mentioned in this menu. The paper should be written in MS-Word Format (*.DOC,*.DOCX).

The Author can submit the paper either online or offline. The authors should prefer online submission.Online Submission: There are three ways to submit your paper:

(A) (I) First, register yourself using top right corner of Home page then Login. If you are already registered, then login using your username and password.

(II) Choose corresponding Journal.

(III) Click 'Submit Manuscript'. Fill required information and Upload the paper.

(B) If you are using Internet Explorer, then Direct Submission through Homepage is also available.

(C) If these two are not convenient, and then email the paper directly to dean@globaljournals.org.

Offline Submission: Author can send the typed form of paper by Post. However, online submission should be preferred.

Preferred Author Guidelines

MANUSCRIPT STYLE INSTRUCTION (Must be strictly followed)

Page Size: 8.27" X 11'"

- Left Margin: 0.65
- Right Margin: 0.65
- Top Margin: 0.75
- Bottom Margin: 0.75
- Font type of all text should be Swis 721 Lt BT.
- Paper Title should be of Font Size 24 with one Column section.
- Author Name in Font Size of 11 with one column as of Title.
- Abstract Font size of 9 Bold, "Abstract" word in Italic Bold.
- Main Text: Font size 10 with justified two columns section
- Two Column with Equal Column with of 3.38 and Gaping of .2
- First Character must be three lines Drop capped.
- Paragraph before Spacing of 1 pt and After of 0 pt.
- Line Spacing of 1 pt
- Large Images must be in One Column
- Numbering of First Main Headings (Heading 1) must be in Roman Letters, Capital Letter, and Font Size of 10.
- Numbering of Second Main Headings (Heading 2) must be in Alphabets, Italic, and Font Size of 10.

You can use your own standard format also.
Author Guidelines:

1. General,

2. Ethical Guidelines,

3. Submission of Manuscripts,

4. Manuscript's Category,

5. Structure and Format of Manuscript,

6. After Acceptance.

1. GENERAL

Before submitting your research paper, one is advised to go through the details as mentioned in following heads. It will be beneficial, while peer reviewer justify your paper for publication.

Scope

The Global Journals Inc. (US) welcome the submission of original paper, review paper, survey article relevant to the all the streams of Philosophy and knowledge. The Global Journals Inc. (US) is parental platform for Global Journal of Computer Science and Technology, Researches in Engineering, Medical Research, Science Frontier Research, Human Social Science, Management, and Business organization. The choice of specific field can be done otherwise as following in Abstracting and Indexing Page on this Website. As the all Global

Journals Inc. (US) are being abstracted and indexed (in process) by most of the reputed organizations. Topics of only narrow interest will not be accepted unless they have wider potential or consequences.

2. ETHICAL GUIDELINES

Authors should follow the ethical guidelines as mentioned below for publication of research paper and research activities.

Papers are accepted on strict understanding that the material in whole or in part has not been, nor is being, considered for publication elsewhere. If the paper once accepted by Global Journals Inc. (US) and Editorial Board, will become the copyright of the Global Journals Inc. (US).

Authorship: The authors and coauthors should have active contribution to conception design, analysis and interpretation of findings. They should critically review the contents and drafting of the paper. All should approve the final version of the paper before submission

The Global Journals Inc. (US) follows the definition of authorship set up by the Global Academy of Research and Development. According to the Global Academy of R&D authorship, criteria must be based on:

1) Substantial contributions to conception and acquisition of data, analysis and interpretation of the findings.

2) Drafting the paper and revising it critically regarding important academic content.

3) Final approval of the version of the paper to be published.

All authors should have been credited according to their appropriate contribution in research activity and preparing paper. Contributors who do not match the criteria as authors may be mentioned under Acknowledgement.

Acknowledgements: Contributors to the research other than authors credited should be mentioned under acknowledgement. The specifications of the source of funding for the research if appropriate can be included. Suppliers of resources may be mentioned along with address.

Appeal of Decision: The Editorial Board's decision on publication of the paper is final and cannot be appealed elsewhere.

Permissions: It is the author's responsibility to have prior permission if all or parts of earlier published illustrations are used in this paper.

Please mention proper reference and appropriate acknowledgements wherever expected.

If all or parts of previously published illustrations are used, permission must be taken from the copyright holder concerned. It is the author's responsibility to take these in writing.

Approval for reproduction/modification of any information (including figures and tables) published elsewhere must be obtained by the authors/copyright holders before submission of the manuscript. Contributors (Authors) are responsible for any copyright fee involved.

3. SUBMISSION OF MANUSCRIPTS

Manuscripts should be uploaded via this online submission page. The online submission is most efficient method for submission of papers, as it enables rapid distribution of manuscripts and consequently speeds up the review procedure. It also enables authors to know the status of their own manuscripts by emailing us. Complete instructions for submitting a paper is available below.

Manuscript submission is a systematic procedure and little preparation is required beyond having all parts of your manuscript in a given format and a computer with an Internet connection and a Web browser. Full help and instructions are provided on-screen. As an author, you will be prompted for login and manuscript details as Field of Paper and then to upload your manuscript file(s) according to the instructions.

To avoid postal delays, all transaction is preferred by e-mail. A finished manuscript submission is confirmed by e-mail immediately and your paper enters the editorial process with no postal delays. When a conclusion is made about the publication of your paper by our Editorial Board, revisions can be submitted online with the same procedure, with an occasion to view and respond to all comments.

Complete support for both authors and co-author is provided.

4. MANUSCRIPT'S CATEGORY

Based on potential and nature, the manuscript can be categorized under the following heads:

Original research paper: Such papers are reports of high-level significant original research work.

Review papers: These are concise, significant but helpful and decisive topics for young researchers.

Research articles: These are handled with small investigation and applications

Research letters: The letters are small and concise comments on previously published matters.

5.STRUCTURE AND FORMAT OF MANUSCRIPT

The recommended size of original research paper is less than seven thousand words, review papers fewer than seven thousands words also.Preparation of research paper or how to write research paper, are major hurdle, while writing manuscript. The research articles and research letters should be fewer than three thousand words, the structure original research paper; sometime review paper should be as follows:

Papers: These are reports of significant research (typically less than 7000 words equivalent, including tables, figures, references), and comprise:

(a)Title should be relevant and commensurate with the theme of the paper.

(b) A brief Summary, "Abstract" (less than 150 words) containing the major results and conclusions.

(c) Up to ten keywords, that precisely identifies the paper's subject, purpose, and focus.

(d) An Introduction, giving necessary background excluding subheadings; objectives must be clearly declared.

(e) Resources and techniques with sufficient complete experimental details (wherever possible by reference) to permit repetition; sources of information must be given and numerical methods must be specified by reference, unless non-standard.

(f) Results should be presented concisely, by well-designed tables and/or figures; the same data may not be used in both; suitable statistical data should be given. All data must be obtained with attention to numerical detail in the planning stage. As reproduced design has been recognized to be important to experiments for a considerable time, the Editor has decided that any paper that appears not to have adequate numerical treatments of the data will be returned un-refereed;

(g) Discussion should cover the implications and consequences, not just recapitulating the results; conclusions should be summarizing.

(h) Brief Acknowledgements.

(i) References in the proper form.

Authors should very cautiously consider the preparation of papers to ensure that they communicate efficiently. Papers are much more likely to be accepted, if they are cautiously designed and laid out, contain few or no errors, are summarizing, and be conventional to the approach and instructions. They will in addition, be published with much less delays than those that require much technical and editorial correction.

The Editorial Board reserves the right to make literary corrections and to make suggestions to improve briefness.

It is vital, that authors take care in submitting a manuscript that is written in simple language and adheres to published guidelines.

Format

Language: The language of publication is UK English. Authors, for whom English is a second language, must have their manuscript efficiently edited by an English-speaking person before submission to make sure that, the English is of high excellence. It is preferable, that manuscripts should be professionally edited.

Standard Usage, Abbreviations, and Units: Spelling and hyphenation should be conventional to The Concise Oxford English Dictionary. Statistics and measurements should at all times be given in figures, e.g. 16 min, except for when the number begins a sentence. When the number does not refer to a unit of measurement it should be spelt in full unless, it is 160 or greater.

Abbreviations supposed to be used carefully. The abbreviated name or expression is supposed to be cited in full at first usage, followed by the conventional abbreviation in parentheses.

Metric SI units are supposed to generally be used excluding where they conflict with current practice or are confusing. For illustration, 1.4 l rather than 1.4 × 10-3 m3, or 4 mm somewhat than 4 × 10-3 m. Chemical formula and solutions must identify the form used, e.g. anhydrous or hydrated, and the concentration must be in clearly defined units. Common species names should be followed by underlines at the first mention. For following use the generic name should be constricted to a single letter, if it is clear.

Structure

All manuscripts submitted to Global Journals Inc. (US), ought to include:

Title: The title page must carry an instructive title that reflects the content, a running title (less than 45 characters together with spaces), names of the authors and co-authors, and the place(s) wherever the work was carried out. The full postal address in addition with the e-mail address of related author must be given. Up to eleven keywords or very brief phrases have to be given to help data retrieval, mining and indexing.

Abstract, used in Original Papers and Reviews:

Optimizing Abstract for Search Engines

Many researchers searching for information online will use search engines such as Google, Yahoo or similar. By optimizing your paper for search engines, you will amplify the chance of someone finding it. This in turn will make it more likely to be viewed and/or cited in a further work. Global Journals Inc. (US) have compiled these guidelines to facilitate you to maximize the web-friendliness of the most public part of your paper.

Key Words

A major linchpin in research work for the writing research paper is the keyword search, which one will employ to find both library and Internet resources.

One must be persistent and creative in using keywords. An effective keyword search requires a strategy and planning a list of possible keywords and phrases to try.

Search engines for most searches, use Boolean searching, which is somewhat different from Internet searches. The Boolean search uses "operators," words (and, or, not, and near) that enable you to expand or narrow your affords. Tips for research paper while preparing research paper are very helpful guideline of research paper.

Choice of key words is first tool of tips to write research paper. Research paper writing is an art.A few tips for deciding as strategically as possible about keyword search:

- One should start brainstorming lists of possible keywords before even begin searching. Think about the most important concepts related to research work. Ask, "What words would a source have to include to be truly valuable in research paper?" Then consider synonyms for the important words.
- It may take the discovery of only one relevant paper to let steer in the right keyword direction because in most databases, the keywords under which a research paper is abstracted are listed with the paper.
- One should avoid outdated words.

Keywords are the key that opens a door to research work sources. Keyword searching is an art in which researcher's skills are bound to improve with experience and time.

Numerical Methods: Numerical methods used should be clear and, where appropriate, supported by references.

Acknowledgements: Please make these as concise as possible.

References

References follow the Harvard scheme of referencing. References in the text should cite the authors' names followed by the time of their publication, unless there are three or more authors when simply the first author's name is quoted followed by et al. unpublished work has to only be cited where necessary, and only in the text. Copies of references in press in other journals have to be supplied with submitted typescripts. It is necessary that all citations and references be carefully checked before submission, as mistakes or omissions will cause delays.

References to information on the World Wide Web can be given, but only if the information is available without charge to readers on an official site. Wikipedia and Similar websites are not allowed where anyone can change the information. Authors will be asked to make available electronic copies of the cited information for inclusion on the Global Journals Inc. (US) homepage at the judgment of the Editorial Board.

The Editorial Board and Global Journals Inc. (US) recommend that, citation of online-published papers and other material should be done via a DOI (digital object identifier). If an author cites anything, which does not have a DOI, they run the risk of the cited material not being noticeable.

The Editorial Board and Global Journals Inc. (US) recommend the use of a tool such as Reference Manager for reference management and formatting.

Tables, Figures and Figure Legends

Tables: Tables should be few in number, cautiously designed, uncrowned, and include only essential data. Each must have an Arabic number, e.g. Table 4, a self-explanatory caption and be on a separate sheet. Vertical lines should not be used.

Figures: Figures are supposed to be submitted as separate files. Always take in a citation in the text for each figure using Arabic numbers, e.g. Fig. 4. Artwork must be submitted online in electronic form by e-mailing them.

Preparation of Electronic Figures for Publication

Even though low quality images are sufficient for review purposes, print publication requires high quality images to prevent the final product being blurred or fuzzy. Submit (or e-mail) EPS (line art) or TIFF (halftone/photographs) files only. MS PowerPoint and Word Graphics are unsuitable for printed pictures. Do not use pixel-oriented software. Scans (TIFF only) should have a resolution of at least 350 dpi (halftone) or 700 to 1100 dpi (line drawings) in relation to the imitation size. Please give the data for figures in black and white or submit a Color Work Agreement Form. EPS files must be saved with fonts embedded (and with a TIFF preview, if possible).

For scanned images, the scanning resolution (at final image size) ought to be as follows to ensure good reproduction: line art: >650 dpi; halftones (including gel photographs) : >350 dpi; figures containing both halftone and line images: >650 dpi.

Figure Legends: Self-explanatory legends of all figures should be incorporated separately under the heading 'Legends to Figures'. In the full-text online edition of the journal, figure legends may possibly be truncated in abbreviated links to the full screen version. Therefore, the first 100 characters of any legend should notify the reader, about the key aspects of the figure.

6. AFTER ACCEPTANCE

Upon approval of a paper for publication, the manuscript will be forwarded to the dean, who is responsible for the publication of the Global Journals Inc. (US).

6.1 Proof Corrections

The corresponding author will receive an e-mail alert containing a link to a website or will be attached. A working e-mail address must therefore be provided for the related author.

Acrobat Reader will be required in order to read this file. This software can be downloaded

(Free of charge) from the following website:

www.adobe.com/products/acrobat/readstep2.html. This will facilitate the file to be opened, read on screen, and printed out in order for any corrections to be added. Further instructions will be sent with the proof.

Proofs must be returned to the dean at dean@globaljournals.org within three days of receipt.

As changes to proofs are costly, we inquire that you only correct typesetting errors. All illustrations are retained by the publisher. Please note that the authors are responsible for all statements made in their work, including changes made by the copy editor.

6.2 Early View of Global Journals Inc. (US) (Publication Prior to Print)

The Global Journals Inc. (US) are enclosed by our publishing's Early View service. Early View articles are complete full-text articles sent in advance of their publication. Early View articles are absolute and final. They have been completely reviewed, revised and edited for publication, and the authors' final corrections have been incorporated. Because they are in final form, no changes can be made after sending them. The nature of Early View articles means that they do not yet have volume, issue or page numbers, so Early View articles cannot be cited in the conventional way.

6.3 Author Services

Online production tracking is available for your article through Author Services. Author Services enables authors to track their article - once it has been accepted - through the production process to publication online and in print. Authors can check the status of their articles online and choose to receive automated e-mails at key stages of production. The authors will receive an e-mail with a unique link that enables them to register and have their article automatically added to the system. Please ensure that a complete e-mail address is provided when submitting the manuscript.

6.4 Author Material Archive Policy

Please note that if not specifically requested, publisher will dispose off hardcopy & electronic information submitted, after the two months of publication. If you require the return of any information submitted, please inform the Editorial Board or dean as soon as possible.

6.5 Offprint and Extra Copies

A PDF offprint of the online-published article will be provided free of charge to the related author, and may be distributed according to the Publisher's terms and conditions. Additional paper offprint may be ordered by emailing us at: editor@globaljournals.org .

You must strictly follow above Author Guidelines before submitting your paper or else we will not at all be responsible for any corrections in future in any of the way.

Before start writing a good quality Computer Science Research Paper, let us first understand what is Computer Science Research Paper? So, Computer Science Research Paper is the paper which is written by professionals or scientists who are associated to Computer Science and Information Technology, or doing research study in these areas. If you are novel to this field then you can consult about this field from your supervisor or guide.

TECHNIQUES FOR WRITING A GOOD QUALITY RESEARCH PAPER:

1. Choosing the topic: In most cases, the topic is searched by the interest of author but it can be also suggested by the guides. You can have several topics and then you can judge that in which topic or subject you are finding yourself most comfortable. This can be done by asking several questions to yourself, like Will I be able to carry our search in this area? Will I find all necessary recourses to accomplish the search? Will I be able to find all information in this field area? If the answer of these types of questions will be "Yes" then you can choose that topic. In most of the cases, you may have to conduct the surveys and have to visit several places because this field is related to Computer Science and Information Technology. Also, you may have to do a lot of work to find all rise and falls regarding the various data of that subject. Sometimes, detailed information plays a vital role, instead of short information.

2. Evaluators are human: First thing to remember that evaluators are also human being. They are not only meant for rejecting a paper. They are here to evaluate your paper. So, present your Best.

3. Think Like Evaluators: If you are in a confusion or getting demotivated that your paper will be accepted by evaluators or not, then think and try to evaluate your paper like an Evaluator. Try to understand that what an evaluator wants in your research paper and automatically you will have your answer.

4. Make blueprints of paper: The outline is the plan or framework that will help you to arrange your thoughts. It will make your paper logical. But remember that all points of your outline must be related to the topic you have chosen.

5. Ask your Guides: If you are having any difficulty in your research, then do not hesitate to share your difficulty to your guide (if you have any). They will surely help you out and resolve your doubts. If you can't clarify what exactly you require for your work then ask the supervisor to help you with the alternative. He might also provide you the list of essential readings.

6. Use of computer is recommended: As you are doing research in the field of Computer Science, then this point is quite obvious.

7. Use right software: Always use good quality software packages. If you are not capable to judge good software then you can lose quality of your paper unknowingly. There are various software programs available to help you, which you can get through Internet.

8. Use the Internet for help: An excellent start for your paper can be by using the Google. It is an excellent search engine, where you can have your doubts resolved. You may also read some answers for the frequent question how to write my research paper or find model research paper. From the internet library you can download books. If you have all required books make important reading selecting and analyzing the specified information. Then put together research paper sketch out.

9. Use and get big pictures: Always use encyclopedias, Wikipedia to get pictures so that you can go into the depth.

10. Bookmarks are useful: When you read any book or magazine, you generally use bookmarks, right! It is a good habit, which helps to not to lose your continuity. You should always use bookmarks while searching on Internet also, which will make your search easier.

11. Revise what you wrote: When you write anything, always read it, summarize it and then finalize it.

12. Make all efforts: Make all efforts to mention what you are going to write in your paper. That means always have a good start. Try to mention everything in introduction, that what is the need of a particular research paper. Polish your work by good skill of writing and always give an evaluator, what he wants.

13. Have backups: When you are going to do any important thing like making research paper, you should always have backup copies of it either in your computer or in paper. This will help you to not to lose any of your important.

14. Produce good diagrams of your own: Always try to include good charts or diagrams in your paper to improve quality. Using several and unnecessary diagrams will degrade the quality of your paper by creating "hotchpotch." So always, try to make and include those diagrams, which are made by your own to improve readability and understandability of your paper.

15. Use of direct quotes: When you do research relevant to literature, history or current affairs then use of quotes become essential but if study is relevant to science then use of quotes is not preferable.

16. Use proper verb tense: Use proper verb tenses in your paper. Use past tense, to present those events that happened. Use present tense to indicate events that are going on. Use future tense to indicate future happening events. Use of improper and wrong tenses will confuse the evaluator. Avoid the sentences that are incomplete.

17. Never use online paper: If you are getting any paper on Internet, then never use it as your research paper because it might be possible that evaluator has already seen it or maybe it is outdated version.

18. **Pick a good study spot:** To do your research studies always try to pick a spot, which is quiet. Every spot is not for studies. Spot that suits you choose it and proceed further.

19. Know what you know: Always try to know, what you know by making objectives. Else, you will be confused and cannot achieve your target.

20. Use good quality grammar: Always use a good quality grammar and use words that will throw positive impact on evaluator. Use of good quality grammar does not mean to use tough words, that for each word the evaluator has to go through dictionary. Do not start sentence with a conjunction. Do not fragment sentences. Eliminate one-word sentences. Ignore passive voice. Do not ever use a big word when a diminutive one would suffice. Verbs have to be in agreement with their subjects. Prepositions are not expressions to finish sentences with. It is incorrect to ever divide an infinitive. Avoid clichés like the disease. Also, always shun irritating alliteration. Use language that is simple and straight forward. put together a neat summary.

21. Arrangement of information: Each section of the main body should start with an opening sentence and there should be a changeover at the end of the section. Give only valid and powerful arguments to your topic. You may also maintain your arguments with records.

22. Never start in last minute: Always start at right time and give enough time to research work. Leaving everything to the last minute will degrade your paper and spoil your work.

23. Multitasking in research is not good: Doing several things at the same time proves bad habit in case of research activity. Research is an area, where everything has a particular time slot. Divide your research work in parts and do particular part in particular time slot.

24. Never copy others' work: Never copy others' work and give it your name because if evaluator has seen it anywhere you will be in trouble.

25. Take proper rest and food: No matter how many hours you spend for your research activity, if you are not taking care of your health then all your efforts will be in vain. For a quality research, study is must, and this can be done by taking proper rest and food.

26. Go for seminars: Attend seminars if the topic is relevant to your research area. Utilize all your resources.

27. Refresh your mind after intervals: Try to give rest to your mind by listening to soft music or by sleeping in intervals. This will also improve your memory.

28. Make colleagues: Always try to make colleagues. No matter how sharper or intelligent you are, if you make colleagues you can have several ideas, which will be helpful for your research.

29. **Think technically:** Always think technically. If anything happens, then search its reasons, its benefits, and demerits.

30. Think and then print: When you will go to print your paper, notice that tables are not be split, headings are not detached from their descriptions, and page sequence is maintained.

31. Adding unnecessary information: Do not add unnecessary information, like, I have used MS Excel to draw graph. Do not add irrelevant and inappropriate material. These all will create superfluous. Foreign terminology and phrases are not apropos. One should NEVER take a broad view. Analogy in script is like feathers on a snake. Not at all use a large word when a very small one would be sufficient. Use words properly, regardless of how others use them. Remove quotations. Puns are for kids, not grunt readers. Amplification is a billion times of inferior quality than sarcasm.

32. Never oversimplify everything: To add material in your research paper, never go for oversimplification. This will definitely irritate the evaluator. Be more or less specific. Also too, by no means, ever use rhythmic redundancies. Contractions aren't essential and shouldn't be there used. Comparisons are as terrible as clichés. Give up ampersands and abbreviations, and so on. Remove commas, that are, not necessary. Parenthetical words however should be together with this in commas. Understatement is all the time the complete best way to put onward earth-shaking thoughts. Give a detailed literary review.

33. Report concluded results: Use concluded results. From raw data, filter the results and then conclude your studies based on measurements and observations taken. Significant figures and appropriate number of decimal places should be used. Parenthetical remarks are prohibitive. Proofread carefully at final stage. In the end give outline to your arguments. Spot out perspectives of further study of this subject. Justify your conclusion by at the bottom of them with sufficient justifications and examples.

34. After conclusion: Once you have concluded your research, the next most important step is to present your findings. Presentation is extremely important as it is the definite medium though which your research is going to be in print to the rest of the crowd. Care should be taken to categorize your thoughts well and present them in a logical and neat manner. A good quality research paper format is essential because it serves to highlight your research paper and bring to light all necessary aspects in your research.

Informal Guidelines of Research Paper Writing

Key points to remember:

- Submit all work in its final form.
- Write your paper in the form, which is presented in the guidelines using the template.
- Please note the criterion for grading the final paper by peer-reviewers.

Final Points:

A purpose of organizing a research paper is to let people to interpret your effort selectively. The journal requires the following sections, submitted in the order listed, each section to start on a new page.

The introduction will be compiled from reference matter and will reflect the design processes or outline of basis that direct you to make study. As you will carry out the process of study, the method and process section will be constructed as like that. The result segment will show related statistics in nearly sequential order and will direct the reviewers next to the similar intellectual paths throughout the data that you took to carry out your study. The discussion section will provide understanding of the data and projections as to the implication of the results. The use of good quality references all through the paper will give the effort trustworthiness by representing an alertness of prior workings.

Writing a research paper is not an easy job no matter how trouble-free the actual research or concept. Practice, excellent preparation, and controlled record keeping are the only means to make straightforward the progression.

General style:

Specific editorial column necessities for compliance of a manuscript will always take over from directions in these general guidelines.

To make a paper clear

· Adhere to recommended page limits

Mistakes to evade

- Insertion a title at the foot of a page with the subsequent text on the next page
- Separating a table/chart or figure - impound each figure/table to a single page
- Submitting a manuscript with pages out of sequence

In every sections of your document

· Use standard writing style including articles ("a", "the," etc.)

· Keep on paying attention on the research topic of the paper

· Use paragraphs to split each significant point (excluding for the abstract)

· Align the primary line of each section

· Present your points in sound order

· Use present tense to report well accepted

· Use past tense to describe specific results

· Shun familiar wording, don't address the reviewer directly, and don't use slang, slang language, or superlatives

· Shun use of extra pictures - include only those figures essential to presenting results

Title Page:

Choose a revealing title. It should be short. It should not have non-standard acronyms or abbreviations. It should not exceed two printed lines. It should include the name(s) and address (es) of all authors.

Abstract:

The summary should be two hundred words or less. It should briefly and clearly explain the key findings reported in the manuscript--must have precise statistics. It should not have abnormal acronyms or abbreviations. It should be logical in itself. Shun citing references at this point.

An abstract is a brief distinct paragraph summary of finished work or work in development. In a minute or less a reviewer can be taught the foundation behind the study, common approach to the problem, relevant results, and significant conclusions or new questions.

Write your summary when your paper is completed because how can you write the summary of anything which is not yet written? Wealth of terminology is very essential in abstract. Yet, use comprehensive sentences and do not let go readability for briefness. You can maintain it succinct by phrasing sentences so that they provide more than lone rationale. The author can at this moment go straight to shortening the outcome. Sum up the study, with the subsequent elements in any summary. Try to maintain the initial two items to no more than one ruling each.

- Reason of the study - theory, overall issue, purpose
- Fundamental goal
- To the point depiction of the research
- Consequences, including definite statistics - if the consequences are quantitative in nature, account quantitative data; results of any numerical analysis should be reported
- Significant conclusions or questions that track from the research(es)

Approach:

- Single section, and succinct
- As a outline of job done, it is always written in past tense
- A conceptual should situate on its own, and not submit to any other part of the paper such as a form or table
- Center on shortening results - bound background information to a verdict or two, if completely necessary
- What you account in an conceptual must be regular with what you reported in the manuscript
- Exact spelling, clearness of sentences and phrases, and appropriate reporting of quantities (proper units, important statistics) are just as significant in an abstract as they are anywhere else

Introduction:

The **Introduction** should "introduce" the manuscript. The reviewer should be presented with sufficient background information to be capable to comprehend and calculate the purpose of your study without having to submit to other works. The basis for the study should be offered. Give most important references but shun difficult to make a comprehensive appraisal of the topic. In the introduction, describe the problem visibly. If the problem is not acknowledged in a logical, reasonable way, the reviewer will have no attention in your result. Speak in common terms about techniques used to explain the problem, if needed, but do not present any particulars about the protocols here. Following approach can create a valuable beginning:

- Explain the value (significance) of the study
- Shield the model - why did you employ this particular system or method? What is its compensation? You strength remark on its appropriateness from a abstract point of vision as well as point out sensible reasons for using it.
- Present a justification. Status your particular theory (es) or aim(s), and describe the logic that led you to choose them.
- Very for a short time explain the tentative propose and how it skilled the declared objectives.

Approach:

- Use past tense except for when referring to recognized facts. After all, the manuscript will be submitted after the entire job is done.
- Sort out your thoughts; manufacture one key point with every section. If you make the four points listed above, you will need a least of four paragraphs.

- Present surroundings information only as desirable in order hold up a situation. The reviewer does not desire to read the whole thing you know about a topic.
- Shape the theory/purpose specifically - do not take a broad view.
- As always, give awareness to spelling, simplicity and correctness of sentences and phrases.

Procedures (Methods and Materials):

This part is supposed to be the easiest to carve if you have good skills. A sound written Procedures segment allows a capable scientist to replacement your results. Present precise information about your supplies. The suppliers and clarity of reagents can be helpful bits of information. Present methods in sequential order but linked methodologies can be grouped as a segment. Be concise when relating the protocols. Attempt for the least amount of information that would permit another capable scientist to spare your outcome but be cautious that vital information is integrated. The use of subheadings is suggested and ought to be synchronized with the results section. When a technique is used that has been well described in another object, mention the specific item describing a way but draw the basic principle while stating the situation. The purpose is to text all particular resources and broad procedures, so that another person may use some or all of the methods in one more study or referee the scientific value of your work. It is not to be a step by step report of the whole thing you did, nor is a methods section a set of orders.

Materials:

- Explain materials individually only if the study is so complex that it saves liberty this way.
- Embrace particular materials, and any tools or provisions that are not frequently found in laboratories.
- Do not take in frequently found.
- If use of a definite type of tools.
- Materials may be reported in a part section or else they may be recognized along with your measures.

Methods:

- Report the method (not particulars of each process that engaged the same methodology)
- Describe the method entirely
- To be succinct, present methods under headings dedicated to specific dealings or groups of measures
- Simplify - details how procedures were completed not how they were exclusively performed on a particular day.
- If well known procedures were used, account the procedure by name, possibly with reference, and that's all.

Approach:

- It is embarrassed or not possible to use vigorous voice when documenting methods with no using first person, which would focus the reviewer's interest on the researcher rather than the job. As a result when script up the methods most authors use third person passive voice.
- Use standard style in this and in every other part of the paper - avoid familiar lists, and use full sentences.

What to keep away from

- Resources and methods are not a set of information.
- Skip all descriptive information and surroundings - save it for the argument.
- Leave out information that is immaterial to a third party.

Results:

The principle of a results segment is to present and demonstrate your conclusion. Create this part a entirely objective details of the outcome, and save all understanding for the discussion.

The page length of this segment is set by the sum and types of data to be reported. Carry on to be to the point, by means of statistics and tables, if suitable, to present consequences most efficiently.You must obviously differentiate material that would usually be incorporated in a study editorial from any unprocessed data or additional appendix matter that would not be available. In fact, such matter should not be submitted at all except requested by the instructor.

Content

- Sum up your conclusion in text and demonstrate them, if suitable, with figures and tables.
- In manuscript, explain each of your consequences, point the reader to remarks that are most appropriate.
- Present a background, such as by describing the question that was addressed by creation an exacting study.
- Explain results of control experiments and comprise remarks that are not accessible in a prescribed figure or table, if appropriate.
- Examine your data, then prepare the analyzed (transformed) data in the form of a figure (graph), table, or in manuscript form.

What to stay away from

- Do not discuss or infer your outcome, report surroundings information, or try to explain anything.
- Not at all, take in raw data or intermediate calculations in a research manuscript.
- Do not present the similar data more than once.
- Manuscript should complement any figures or tables, not duplicate the identical information.
- Never confuse figures with tables - there is a difference.

Approach

- As forever, use past tense when you submit to your results, and put the whole thing in a reasonable order.
- Put figures and tables, appropriately numbered, in order at the end of the report
- If you desire, you may place your figures and tables properly within the text of your results part.

Figures and tables

- If you put figures and tables at the end of the details, make certain that they are visibly distinguished from any attach appendix materials, such as raw facts
- Despite of position, each figure must be numbered one after the other and complete with subtitle
- In spite of position, each table must be titled, numbered one after the other and complete with heading
- All figure and table must be adequately complete that it could situate on its own, divide from text

Discussion:

The Discussion is expected the trickiest segment to write and describe. A lot of papers submitted for journal are discarded based on problems with the Discussion. There is no head of state for how long a argument should be. Position your understanding of the outcome visibly to lead the reviewer through your conclusions, and then finish the paper with a summing up of the implication of the study. The purpose here is to offer an understanding of your results and hold up for all of your conclusions, using facts from your research and generally accepted information, if suitable. The implication of result should be visibly described. Infer your data in the conversation in suitable depth. This means that when you clarify an observable fact you must explain mechanisms that may account for the observation. If your results vary from your prospect, make clear why that may have happened. If your results agree, then explain the theory that the proof supported. It is never suitable to just state that the data approved with prospect, and let it drop at that.

- Make a decision if each premise is supported, discarded, or if you cannot make a conclusion with assurance. Do not just dismiss a study or part of a study as "uncertain."
- Research papers are not acknowledged if the work is imperfect. Draw what conclusions you can based upon the results that you have, and take care of the study as a finished work
- You may propose future guidelines, such as how the experiment might be personalized to accomplish a new idea.
- Give details all of your remarks as much as possible, focus on mechanisms.
- Make a decision if the tentative design sufficiently addressed the theory, and whether or not it was correctly restricted.
- Try to present substitute explanations if sensible alternatives be present.
- One research will not counter an overall question, so maintain the large picture in mind, where do you go next? The best studies unlock new avenues of study. What questions remain?
- Recommendations for detailed papers will offer supplementary suggestions.

Approach:

- When you refer to information, differentiate data generated by your own studies from available information
- Submit to work done by specific persons (including you) in past tense.
- Submit to generally acknowledged facts and main beliefs in present tense.

Administration Rules Listed Before Submitting Your Research Paper to Global Journals Inc. (US)

Please carefully note down following rules and regulation before submitting your Research Paper to Global Journals Inc. (US):

Segment Draft and Final Research Paper: You have to strictly follow the template of research paper. If it is not done your paper may get rejected.

- The **major constraint** is that you must independently make all content, tables, graphs, and facts that are offered in the paper. You must write each part of the paper wholly on your own. The Peer-reviewers need to identify your own perceptive of the concepts in your own terms. NEVER extract straight from any foundation, and never rephrase someone else's analysis.

- Do not give permission to anyone else to "PROOFREAD" your manuscript.

- Methods to avoid Plagiarism is applied by us on every paper, if found guilty, you will be blacklisted by all of our collaborated research groups, your institution will be informed for this and strict legal actions will be taken immediately.)
- To guard yourself and others from possible illegal use please do not permit anyone right to use to your paper and files.

Criterion for Grading a Research Paper (Compilation) by Global Journals Inc. (US)

Please note that following table is only a Grading of "Paper Compilation" and not on "Performed/Stated Research" whose grading solely depends on Individual Assigned Peer Reviewer and Editorial Board Member. These can be available only on request and after decision of Paper. This report will be the property of Global Journals Inc. (US).

	Grades		
	A-B	**C-D**	**E-F**
