In Vitro Antidiabetic Activity of *Cardiospermum Halicacabum* leaves Extracts

*Rao's College Of Pharmacy, India*

**Abstract** - **Objective**: The present study was designed to investigate the glucose uptake of (antidiabetic activity) crude n-hexane, ethanol, methanol and aqueous leaf extracts of *Cardiospermum Halicacabum*.

**Methods**: leaf extracts were subjected to inhibitory effect of glucose utilization using specific standard in vitro procedure.

**Results**: results in four different leaf extracts revealed that, the methanol extract at a concentration of 50 g plant extract/l was found to be more potent than other extracts with the lowest mean glucose concentration of 201 ± 1.69 mg/dl at the end of 27 hrs.

**Conclusions**: The present findings suggest that, the methanolic extract showed a significant inhibitory effect on glucose diffusion in vitro thus validating the traditional claim of the plant.

**Keywords**: *cardiospermum halicacabum*, antidiabetic activity, glucose diffusion method.

**GJMR-B Classification**: NLMC Code: QV 4

In Vitro Antidiabetic Activity of *Cardiospermum Halicacabum* leaves Extracts

**Abstract**: Objective: The present study was designed to investigate the glucose uptake of (antidiabetic activity) crude n-hexane, ethanol, methanol and aqueous leaf extracts of *Cardiospermum Halicacabum*.

Methods: of *Cardiospermum Halicacabum* leaf extracts were subjected to inhibitory effect of glucose utilization using specific standard in vitro procedure.

Results: results in four different leaf extracts revealed that, the methanol extract at a concentration of 50g plant extract/l was found to be more potent than other extracts with the lowest mean glucose concentration of 201±1.69 mg/dl at the end of 27 hrs.

Conclusions: The present findings suggest that, the methanolic extract showed a significant inhibitory effect on glucose diffusion in vitro thus validating the traditional claim of the plant.

Keywords: cardiospermum halicacabum, antidiabetic activity, glucose diffusion method.

**I. INTRODUCTION**

Diabetes mellitus is a metabolic disorder characterized by a loss of glucose homeostasis with disturbances of carbohydrate, fat and protein metabolism resulting from defects in insulin secretion, insulin action, or both[1]. According to WHO, it is estimated that 3% of the world’s population have diabetes and the prevalence is expected to double by the year 2025 to 6.3% [2]. Management of diabetes without any side effect is still a challenge to the medical community. The use of the drugs is restricted by their pharmacokinetic properties, secondary failure rates and accompanying side effects[3]. Thus searching for a new class of compounds is essential to overcome diabetic problems. There is continuous search for alternative drugs[4].

The plant *Cardiospermum halicacabum* Linn. (Sapindaceae) is an annual or sometimes perennial climber, commonly found as a weed throughout India. The tender, young shoots are used as vegetable, fodder, diuretic, stomachic, and rubefacient[5,6]. It is used in rheumatism, lumbago, nervous diseases, and as a demulcent in orchitis and in dropsy. In Sri Lanka, it is used for the treatment of skeletal fractures. The juice of the herb is used to cure ear-ache and to reduce hardened tumours[7]. It exhibits significant analgesic, anti-inflammatory and vaso-depressant activity, which is transient in nature. In vitro studies have revealed its antispasmodic and curative actions confirming the use of the herb in Ayurvedic medicine[8]. The leaves of this plant mixed with castor oil are administered internally to treat rheumatism and to check lumbago[9]. The present investigation is directed to the exploration of the antidiabetic activity based on the study of the various extracts of *Cardiospermum halicacabum* which show inhibitory effect of glucose utilization and are in use as hypoglycemic agent in traditional system of medicine.

**II. MATERIALS AND METHODS**

**a) Plant material**

The fresh plants of *Cardiospermum halicacabum* were collected from Nellore (Andhra Pradesh) and authenticated by Dr.P.Jayaraman, Ph.D., Director, Plant Anatomy Research Centre, Medicinal Plants Research Unit, Tambaram, Chennai-45. A portion of the sample was kept in the department museum for further reference (PARC/2010/579).

**b) Preparation of extracts**

The shade dried powdered form of leaves of *Cardiospermum halicacabum* were taken and subjected to successive extraction using n-hexane, Ethanol, and methanol by continuous percolation process in soxhlet apparatus. The aqueous extract was prepared by the maceration with double distilled water. Each extract was concentrated by distilling off the solvent and evaporated to dryness. The extracts were dissolved in 1% carboxy methyl cellulose (CMC) and used for the present study.

**c) Effects of Various Extracts on In vitro Inhibitory Glucose Diffusion**

A simple model system was used to evaluate the effects of *Cardiospermum halicacabum* leaf extracts on glucose movement in vitro. The model was adapted from a method described by Edwards et al.[10] which involved the use of a sealed dialysis tube into which 15ml of a solution of glucose and sodium chloride (0.15M) was introduced and the appearance of glucose in the external solution was measured. The model used in the present experiment consisted of a dialysis tube (6cmx15mm) into which 1ml of 50g/litre plant extract in 1% CMC and 1ml of 0.15M sodium chloride containing 0.22M D-glucose was added. The dialysis tube was sealed at each end placed in a 50ml centrifuge tube containing 45ml of 0.15M sodium chloride. The tubes were placed on an orbital shaker and kept at room...
temperature. The movement of glucose into the external solution was monitored at set time intervals.

d) Statistical Analysis

Data are expressed as mean ± S.E.M. Statistical comparisons between groups were done by one way analysis of variance (ANOVA) followed by Tukey Kramer multiple comparison tests to analyze the differences. p<0.001 were considered as significant.

III. RESULTS

a) Effect on Glucose Diffusion

With the distinctive traditional medical opinions and natural medicines mainly originated in herbs, traditional medicine offers good clinical opportunities and shows a bright future in the therapy of diabetes mellitus and its complications. The effect of Cardiospermum halicacabum leaves as anti-diabetic agents has been studied. All extracts showed varying effect on glucose utilization. These extracts caused a significant decrease in glucose concentration during the experiment. The effects of Cardiospermum halicacabum leaves extracts on glucose diffusion inhibition were summarized in Table 1. At the end of 27 hrs, glucose movement of control (without plant extract) in the external solution had reached a plateau with a mean glucose concentration above 300mg/dl (314±2.89). It was evident from the table that the methanol and aqueous extracts were found to be potent inhibitors of glucose diffusion (p<0.001) compared to control. The methanol extract was found to be more potent than other extracts showing the lowest mean glucose concentration of 201±1.69 mg/dl at the end of 27 hrs (Table 1).

Table 1: Effect of Cardiospermumhalicacabum leaves extracts (50g/litre) on the movement of glucose out of dialysis tube over 27hr incubation period

IV. DISCUSSION

Diabetes mellitus is a debilitating and often life threatening disorder with increasing incidence throughout the world. There is a steady rise in the rate of incidence of Diabetes mellitus and estimated that 1 in 5 may be diabetic by 2025 [11]. Antihyperglycemic activities of most effective plants were in part explained by the ability of the phytoconstituents to increase glucose transport and metabolism in muscle and/or to stimulate insulin secretion [12]. In the present study, research has been carried out to evaluate the potential of various extracts to additionally retard the diffusion and movement of glucose in the intestinal tract [13].

A decoction of Cardiospermum halicacabum leaves is used worldwide for the treatment of various ailments including anti diabetic. The numerous polyphenolic compounds, triterpenoids and other chemical compounds present in the plant may account for the observed antidiabetic effects of the leaf extracts. A Decoction of Cardiospermum halicacabum leaves was screened for hypoglycemic activity on alloxan-induced diabetic rats. In both acute and sub-acute tests, the water extract, at an oral dose of 250 mg/kg, showed statistically significant hypoglycemic activity [14]. The treatment with Cardiospermum halicacabum aqueous leaf extract (0.01-0.625 mg/mL) showed significant inhibition on LDL glycation in a dose-dependent manner. Tannins, flavonoids, apigenin, pinitol and luteolin, and other chemical compounds present in the plant are speculated to account for the observed hypoglycaemic and hypotensive effects of the leaf extract.

V. CONCLUSION

The present study demonstrates the ability of various extracts of Cardiospermum halicacabum to inhibit glucose diffusion using an in vitro model of glucose absorption. In particular, methanol and aqueous extracts represent potential inhibitory of glucose diffusion supplements that may be useful for allowing flexibility in meal planning in type II diabetes. Further studies are required to elucidate whether in vitro effects represent therapeutic potential by limiting postprandial glucose absorptions and for improving glycemic control in type 2 diabetic subjects.
