Phytochemical and Pharmacological Evaluation of Fruits of *Sonneratia apetala*

By Anha Afrin Shefa, Farzana Shabnam Baishakhi, Sharmin Islam & Samir Kumar Sadhu

*Khulna University, Khulna, Bangladesh*

**Abstract** - *Sonneratia apetala*-Buch.-Ham is a mangrove tree from the family, Lythraceae. The aim of the study is to evaluate analgesic, antidiarrhoeal, anthelmintic, cytotoxic activity of the fruits of *S. apetala*. The extract showed dose dependent analgesic activity using acetic acid induced writhing inhibition of the Swiss albino mice. The extract produced 46% and 69% writhing inhibition at the doses of 250 mg/kg and 500 mg/kg body weight respectively while the standard drug (Diclofenac Sodium) produced 82% writhing inhibition at a dose of 25 mg/kg body weight. In vivo antidiarrheal activity was substantiated by significant prolongation of latent period and decrease in total number of stools at four dose level as compared to standard loperamide. In anthelmintic test the extract showed significant and dose dependent decrease in paralysis time and death time of *Haemonchus contortus*, where albendazole was used as standard.

**Keywords:** *Sonneratia apetala*-Buch.-Ham analgesic activity, antidiarrheal activity, anthelmintic test, brine shrimp lethality bioassay.

Abstract- *Sonneratia apetala-Buch.-Ham* is a mangrove tree from the family, Lythraceae. The aim of the study is to evaluate analgesic, antidiarrheal, anthelmintic, cytotoxic activity of the fruits of *S. apetala*. The extract showed dose dependent analgesic activity using acetic acid induced writhing inhibition of the Swiss albino mice. The extract produced 46% and 69% writhing inhibition at the doses of 250 mg/kg and 500 mg/kg body weight respectively while the standard drug (Diclofenac Sodium) produced 82% writhing inhibition at a dose of 25 mg/kg body weight. In vivo antidiarrheal activity was substantiated by significant prolongation of latent period and decrease in total number of stools at four dose level as compared to standard loperamide. In anthelmintic test the extract showed significant and dose dependent decrease in paralysis time and death time of *Haemonchus contortus*, where albendazole was used as standard. In the brine shrimp lethality bioassay, extract showed activity indicated by LC$_{50}$ (61µg/ml) and LC$_{90}$ (616 µg/ml).

Keywords: Sonneratia apetala-Buch.-Ham analgesic activity, antidiarrheal activity, anthelmintic test, brine shrimp lethality bioassay.

1. INTRODUCTION

Plants and herbs have been in use for both cure and prevention of diseases. Man has been experimenting with the plants; some used for food, others for dress, and stills others for treatment of diseases and to keep personnel in a state of health. Researchers are searching for bioactive molecules responsible for specific pharmacological effect in medicinal plants. But edible food can also be a potent source of drug molecules. This leads for the searching of medicinal value of edible fruit. *S. apetala* popularly known as mangrove apple plant belonging to the Lythraceae family and it grows as tree or shrub, distributed through out saline area. The mangrove plant parts of the plant contain a large number of terpenoid, steroid, alkaloid & polysaccharide (Jamale & Joshi, 1998). The antimicrobial activity of the extract of *S. apetala*, on the various test microorganisms, including clinical multiple antibiotic resistant bacteria and phytopathogens were investigated (The Ayurvedic Pharmacopoeia of India.1998 & John, 2007). The seeds contain polyphenols which may be responsible for antibacterial activity and antioxidant activity (Hossain, Basar, Rokeya, Sultana & Rahman, 2012).

Fig.1: Fruits of *Sonneratia apetala*.

Folk Medicinal Healers in Bagerhat district of Bangladesh uses *S. apetala* as Anti-inflammatory and to treat gastrointestinal disorders (including dysentery, diarrhoea, indigestion, colic, acidity, bloating, lack of appetite, stomachache) (Mollik, Hossan, Rahman,, Rownak & Mohammed Rahmatullah, 2010). There is a number of traditional uses and medicinal benefits that is why this plant part was selected for pharmacological investigations.

II. MATERIALS AND METHODS

a) Sample Collection

The fruits of *S. apetala* were collected from the world largest mangrove forest-The Sundarbans. Collected fruits were dried by shade drying. Then these were ground into a coarse powder with the help of a suitable grinder. The powder was stored in an airtight container and kept in a cool, dark and dry place until analysis commenced.
**b) Cold Extraction**

First extraction- 150gm grinded fruits powder was soaked in 600 ml of ethanol in a glass container for seven days accompanying regular shaking and stirring. After fifteen days the extract was separated from the debris by filtration by a piece of clean, white cotton cloth.

Second extraction- The residue was again soaked in 250 ml of ethanol for three days and then was separated from the debris by filtration through by a piece of clean, white cotton cloth.

Total weight of the dried extract of *S. apetala* was 22gm where percent yield was 14%.

c) **Test Animals and Parasites**

Young Swiss-albino mice aged 4-5 weeks, average weight 28-35gm were used for the experiment. The mice were purchased from Department of Pharmacy, Jahangirnagar University, Dhaka. They were housed in standard environmental conditions at animal house of Pharmacy Discipline and fed with rodent diet and water ad libitum. All experimental protocols were in compliance with BCSIR Ethics Committee on Research in Animals as well as internationally accepted principles for laboratory animal use and care. During investigation of anthelmintic property of extract, *Haemonchus contortus* (Nematode), was considered and isolated because it has similarity with parasites living in human body.

d) **Phytochemical Screening Methods**

For alkaloid analysis the extracts was treated with 1% HCl, boiled and filtered. Dragendorff’s was used to indicate the presence of alkaloids (Harborne, 1998) (Trease & Evans 1989), Libermann Burchard and Salkowski tests for the presence steroids, foam test for the presence of saponins, Benedict’s and Fehling’s test for the presence of carbohydrates, test for the presence of glycoside. 5ml of dilute ammonia solution was added to a portion of the aqueous filtrate of plant extract followed by addition of concentrated H2SO4. A yellow coloration observed in each extract indicates the presence of flavonoids. 20gm extract was dissolved in dilute hydrochloric acid. Formation of yellow color and disappearance of color indicate the presence of flavonoid (Agoha, 1981; Barakat, 1973). For the presence of tannins was indicated by ferric chloride and lead acetate test. Presence of gum was evaluated by taking extract and then molish reagent and sulphuric acid were added. Red violet ring was not produced at the junction of two liquids which indicated the absence of gums. To 1 mL of extract, few drops of nitric acid were added by the sides of the test tube and observed for formation of yellow color. This indicates the presence of xanthoprotein. To 0.5 g of the extract, 2 mL of chloroform was added; Conc. H2SO4 (3 mL) was carefully added to form a layer. A reddish brown coloration at the interface indicates the presence of terpenoids. To the alcoholic extract, sodium bicarbonate solution was added and observed for the production of effervescences. Production of effervescences indicates the presence of acidic compound (Amer, Abou-Shoer , Abdel-Kader, El-Shaibany, Abdel-Salam, 2004)

e) **Evaluation of Analgesic Activity**

The analgesic activity of extract was studied using acetic acid induced writhing model in mice (Whittle,1964; Ahmed, Selim, Das, Choudhuri, 2004). The animals were divided into control, standard and test groups with five mice in each group. The animals of test groups received test substance at the dose of 250 and 500 mg/kg body weight. Standard group was administered with Diclofenac Na (standard drug) at the dose of 25 mg/kg body weight and vehicle control group was treated with 1% Tween 80 in water at the dose of 10ml/kg body weight. Test samples, standard drug and control vehicle were administered orally 30 min before intraperitoneal administration of 0.7% acetic acid. After an interval of 15 min, the mice were observed writhing (constriction of abdomen, turning of trunk and extension of hind legs) for 5 min.

**Fig. 2:** Test animal Swiss-albino mice.

f) **Evaluation of Antidiarrhoeal Activity**

The test was performed by castor oil induced diarrhoea in young Swiss-albino mice (Reiner, R. (1982)). The animals are divided into control, positive control and six test groups containing five mice in each group. Control group receive vehicle (1% Tween-80 in water) at a dose of 10 ml/kg body weight orally. The positive control group receive loperamide (IMOTIL 2 mg/Cap., Square Pharmaceuticals Ltd., Bangladesh) at the dose of 3 mg/kg orally; test groups received the crude extracts at the doses of 250 and 500 mg/kg body weight orally. Each animal was placed in individual cage, the floor of which was lined with blotting paper which was changed every hour. Diarrhoea is induced by oral administration of 0.3 ml castor oil to each mouse, 30 min after the above treatments. During the observation period (4hr), the latency periods and the number of diarrheic faeces excrete by the animals is recorded. A numerical score based on stool consistency is assigned as follows: normal stool =1/2 and watery stool = 1.
phytochemical and pharmacological evaluation of fruits of sonneratia apetala

**III. Results and Discussion**

a) Phytochemical Screening

The ethanolic extract of *S. apetala* was subjected to qualitative phytochemical tests for detection of different classes of chemical compounds. Alkaloid, reducing sugar, tannin, steroid, glycoside, flavonoids and acidic compounds were present in the extract.

b) Evaluation of Analgesic Activity

At the dose of 250 mg/kg and 500 mg/kg the extract showed inhibition of writhing inhibition by 46.54% and 69.62% respectively while the standard drug Diclofenac Na inhibition was found to be 82.31% at a dose of 25 mg/kg b.w. The result was statistically significant at the level of p<0.001 (Table 2). The active principle responsible for this analgesic activity may be acidic compounds, terpenoids, reducing sugar, gums, xanthoprotein, flavonoids and tannins (Ahmadiani, Hosseiny, Semnanian, Javan, Saeedi, Kamalinejad & Saremi. 2000; Rajnarayana, Sripal, Chaluvadi. 2001; Choi, Lee, Park. 2005).

c) Evaluation Of Antidiarrhoeal Activity

In the castor oil induced diarrheal mice, extract at various doses lessened the total number of faeces as well as delayed the onset of diarrhea in a dose dependent manner (Table 3). % Inhibition of defecation at doses 62.5mg/kg, 125mg/kg, 250 and 500 mg/kg b. wt. was 74.19, 82.26, 87.90, 94.35 respectively. Standard loperamide also showed decrease in total number of feces and 95.15% inhibition of defecation. It is known that the active component of castor oil is the ricinoleic acid, which is liberated from the action of lipases on castor oil. The ricinoleic acid produces irritating and inflammatory actions on the intestinal mucosa leading to the release of prostaglandins (Yoshio et al., 1999) and stimulating peristaltic (decreasing Na⁺ and K⁺ absorption) activity and diarrhoea (Zavala, Perez, Vargas & Perez. 1998). Loperamide is an opiate/alkaloid analogue (Tripathi K.D. 2008). It Inhibits prostaglandin synthesis and delay diarrhoea induced with castor oil (Sunil, Bedi, Singla & Johri, 2001). Thus alkaloids of *S. apetala* may follow the same pathway as Loperamide does. Moreover, antidyserteric and antidiarrhoeal properties of medicinal plants were found to be due to alkaloids as well as tannins, saponins, flavonoids, sterols and/or triterpenes and reducing sugars (Havagiray, Ramesh & Sadhna. 2004). These constituents are also present in *S. apetala* responsible for antidiarrhoeal activity.

d) Evaluation Of Anthelmintic Activity

In the present study the *S. apetala* was found to show anthelmintic activity when compared to albendazole used as standard drug. Extract at concentrations of 25, 50, 100 and 200 mg/ml showed paralysis at, 441.5, 276, 255, 209 seconds and death time found at 615, 438, 354, 222 seconds respectively. Standard albendazole also showed paralysis time 334, 273 seconds and death time at 379, 338 seconds for concentration of 10 and 15 mg/ml respectively. From the above result, it is clear that *S. apetala* has significant...
anthelmintic activity in dose dependent manner which was comparable with standard anthelmintic drug. This also supports its traditional use as anthelmintic. Albendazole inhibits parasitic microtubule polymerization by binding to β-tubulin (Goodman LS., Gilman A. 11th Edn). As S. apetala showed anthelmintic activity compared to albendazole, may be their pathway is same.

e) Screening for Cytotoxic Activity

In brine shrimp lethality bioassay, the crude extract of S. apetala fruit showed lethality indicating the biological activity of the extract. The percent of mortality vs log concentration was plotted and a best fit line was obtained using LDP line probit analysis software. Through the software LC_{50} and LC_{90} of the test sample were found to be 61µg/ml and 616 µg/ml. As it contains many tanins and other polyphenols, its cytotoxic effect may be correlated some polyphenols perturb the membrane structure (Hossain 2002; Aoshima, 2005).

IV. CONCLUSION

The fruit of S. apetala is extensively consumed in coastal areas of Bangladesh without any known toxicity in humans. Based on our present observations S. apetala has many in vitro and in vivo biological activity. It may be concluded that this mangrove fruit merits further exploration both chemically and biologically to identify the functional principle(s) and mechanism of action.

V. ACKNOWLEDGEMENT

Hereby, the authors would like to thank Pharmacy Discipline, Khulna University, Khulna, Bangladesh for the financial and personnel support during this research.
