Some Subclasses of P-Valent Analytic Functions

By M. P. Jeyaraman, T. K. Suresh & E. Keshava Reddy
easwar Engineering College, Chennai

Abstract - The object of the present paper is to derive the sufficient conditions for certain subclasses of $p$-valent analytic functions in the open unit disk. A number of known results would follow upon specializing the parameters involved in our main results. Also, sufficient conditions are found for function to be univalent.

Keywords : analytic functions, univalent, $p$-valently starlike functions, $p$-valently convex functions.

Abstract - The object of the present paper is to derive the sufficient conditions for certain subclasses of $p$-valent analytic functions in the open unit disk. A number of known results would follow upon specializing the parameters involved in our main results. Also, sufficient conditions are found for function to be univalent.

Keywords and phrases : analytic functions, univalent, $p$-valently starlike functions, $p$-valently convex functions.

1. Introduction and Preliminaries

Let $A(p)$ denote the class of functions of the form

$$f(z) = z^p + \sum_{n=1}^{\infty} a_{p+n} z^{p+n} \quad (p \in \mathbb{N} = \{1, 2, \ldots \}),$$

which are analytic and $p$-valent in the open unit disk $U := \{z : |z| < 1\}$. Let $S$ be the class of analytic and univalent functions in $U$. We note that $A(1) \equiv S$.

A function $f \in A(p)$ is said to be in the class $S^*(p, \alpha)$ of $p$-valently starlike of order $\alpha$ in $U$ if and only if it satisfies the inequality

$$\text{Re} \left\{ \frac{zf'(z)}{f(z)} \right\} > \alpha \quad (z \in U; 0 \leq \alpha < p).$$

On the other hand, a function $f \in A(p)$ is said to be in the class $K(p, \alpha)$ of $p$-valently convex of order $\alpha$ in $U$ if and only if it satisfies the inequality

$$\text{Re} \left\{ 1 + \frac{zf''(z)}{f'(z)} \right\} > \alpha \quad (z \in U; 0 \leq \alpha < p).$$

In particular, we write $S^*(1, 0) := S^*$, $K(1, 0) := K$, where $S^*$ and $K$ are the usual subclass of $A$, consisting of functions which are starlike and convex, respectively (see [1, 2]).
The object of the present paper is to investigate various properties of the following classes of analytic and \( p \)-valent function defined as follows.

A function \( f \in A(p) \) is said to be a member of the class \( \mathcal{B}(\gamma, \beta, p, \alpha) \) if and only if it satisfies the inequality

\[
\left| \frac{\beta \gamma z^3 f'''(z) + (2\beta \gamma + \beta - \gamma)z^2 f''(z) +zf'(z)}{\beta \gamma z^2 f''(z) + (\beta - \gamma)zf'(z) + (1 - \beta + \gamma)f(z)} - p \right| < p - \alpha \tag{1}
\]

for some \( \alpha \), for all \( z \in \mathbb{U} \).

Note that the condition (1) implies that

\[
\text{Re} \left\{ \frac{\beta \gamma z^3 f'''(z) + (2\beta \gamma + \beta - \gamma)z^2 f''(z) +zf'(z)}{\beta \gamma z^2 f''(z) + (\beta - \gamma)zf'(z) + (1 - \beta + \gamma)f(z)} \right\} > \alpha,
\]

\[
(0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < p; p \in \mathbb{N}),
\]

We note that \( \mathcal{B}(0, \beta, p, \alpha) \equiv \mathcal{T}_\beta(p; \alpha) \) is the class studied by Irmak and Raina in [3]. The important subclasses such as \( S^*(p, \alpha), K(p, \alpha), S^* \) and \( K \) are seen to be easily identifiable with the aforesaid class.

In recent times, Irmak et al. [3] and Prajapat [9] investigated certain subclasses of multivalent analytic functions and obtained some sufficient conditions for these classes. In this paper, motivated by the aforementioned works, we obtained sufficient conditions for functions to be a member of the class \( \mathcal{B}(\gamma, \beta, p, \alpha) \). We also indicate some special cases and consequences of the main result. The other results investigated include certain inequalities for \( p \)-valent functions which characterize the properties of starlikeness and convexity in the open unit disk. Furthermore our result unifies the result for a functions belonging to the class of \( p \)-valently starlike function of order \( \alpha \) and \( p \)-valently convex function of order \( \alpha \).

In order to derive our main results, we need the following Lemmas.

**Lemma 1.** [4] Let \( w(z) \) be the non-constant and analytic function in \( \mathbb{U} \) with \( w(0) = 0 \). If \( |w(z)| \) attains its maximum value on the circle \( |z| = r < 1 \) at a point \( z_0 \), then

\[
z_0w'(z_0) = kw(z_0)
\]

where \( k \geq 1 \) is a real number.

**Lemma 2.** [5] Let \( \Omega \) be a set in the complex plane \( \mathbb{C} \) and suppose that \( \Phi(z) \) is a mapping from \( \mathbb{C}^2 \times \mathbb{U} \) to \( \mathbb{C} \) which satisfies \( \Phi(ix, y; z) \notin \Omega \) for \( z \in \mathbb{U} \), and for all real \( x, y \) such that \( y \leq -n(1 + x^2)/2 \). If the function \( q(z) = 1 + q_nz^n + q_{n+1}z^{n+1} + \cdots \) is analytic in \( \mathbb{U} \) such that \( \Phi(q(z), zq'(z); z) \in \Omega \) for all \( z \in \mathbb{U} \), then \( \text{Re} q(z) > 0 \).

**Lemma 3.** [7] Let \( \delta \) be the complex number, \( \text{Re} \delta > 0 \), and \( \lambda \) be a complex number, \( |\lambda| \leq 1, \lambda \neq -1 \) and let \( h(z) = z + a_2z^2 + \cdots \) be a regular function on \( \mathbb{U} \). If

\[
\left| \lambda |z|^{2\delta} + \left( 1 - |z|^{2\delta} \right) \frac{zh''(z)}{\delta h'(z)} \right| \leq 1
\]
Some Subclasses of P-Valent Analytic Functions

for all \( z \in \mathbb{U} \), then the function

\[
F_\delta(z) = \left( \delta \int_0^z t^{\delta-1} h'(t) \, dt \right)^{1/\delta}
\]

\[
= z + \frac{2a_2}{\delta + 1} z^2 + \left( \frac{3a_3}{\delta + 2} + \frac{2\delta(1-\delta)a_2^2}{(\delta + 1)^2} \right) z^3 + \ldots
\]

is regular and univalent in \( \mathbb{U} \).

**Lemma 4.** [8] Let \( \delta \) be a complex number, \( \Re \delta > 0 \), and \( \lambda \) a complex number, \( |\lambda| < 1 \), and \( h \in \mathcal{A} \). If

\[
\frac{1 - |z|^{2\Re \delta}}{\Re \delta} \left| \frac{zh''(z)}{h'(z)} \right| \leq 1 - |\lambda|
\]

for all \( z \in \mathbb{U} \), then for any complex number \( \eta \), \( \Re \eta \geq \Re \delta \), the function

\[
F_\eta(z) = \left( \eta \int_0^z t^{\eta-1} h'(t) \, dt \right)^{1/\eta}
\]

is in the class \( \mathcal{S} \).

**Lemma 5.** [6] Let \( p(z) \) be analytic in \( \mathbb{U} \), \( p(0) = 1 \), \( p(z) \neq 0 \) in \( \mathbb{U} \) and suppose that there exists a point \( z_0 \in \mathbb{U} \) such that

\[
|\arg(p(z))| < \frac{\pi}{2} \alpha, \quad \text{for} \quad |z| < |z_0|, \quad |\arg(p(z_0))| = \frac{\pi}{2} \alpha,
\]

where \( 0 < \alpha \leq 1 \), then we have

\[
\frac{z_0 p'(z_0)}{p(z_0)} = ik \alpha,
\]

where

\[
k \geq \frac{1}{2} \left( a + \frac{1}{a} \right) \geq 1 \quad \text{when} \quad \arg(p(z_0)) = \frac{\pi}{2} \alpha,
\]

\[
k \leq -\frac{1}{2} \left( a + \frac{1}{a} \right) \leq -1 \quad \text{when} \quad \arg(p(z_0)) = -\frac{\pi}{2} \alpha,
\]

\[
p(z_0)^{1/\alpha} = \pm ai, \quad (a > 0).
\]

II. Main Results

By using Lemma 2, we first prove the following theorem.

**Theorem 6.** Let \( f \in \mathcal{A}(p) \). Define a function \( G_{\beta,\gamma} \) by

\[
G_{\beta,\gamma}(z) := \beta \gamma z^2 f''(z) + (\beta - \gamma) z f'(z) + (1 - \beta + \gamma) f(z), \quad (0 \leq \gamma \leq \beta \leq 1; z \in \mathbb{U}),
\]

and if \( G_{\beta,\gamma}(z) \) satisfies

\[
\Re \left\{ \frac{z G'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} \left( 2 + \frac{z G''_{\beta,\gamma}(z)}{G'_{\beta,\gamma}(z)} - \frac{z G'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} \right) \right\} > p \left( 1 - \frac{n}{2} \right) + \frac{n}{2} \alpha
\]

where \( p, n \) are positive integers.

(0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < p; p, n \in \mathbb{N}),

then \( f(z) \in B(\gamma, \beta, p, \alpha) \).

**Proof.** Let \( f \in A(p) \). Define a function \( w(z) \) in \( U \) by

\[
\frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} = p + (p - \alpha)w(z),
\]

(0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < p; p, n \in \mathbb{N}), \quad (3)

then the function \( w(z) \) is analytic in \( U \), and \( w(0) = 0 \).

A computation using (3) shows that

\[
\begin{align*}
\frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \left( 2 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right) &= (p - \alpha)[zw'(z) + w(z)] + p \\
&= \Phi(w(z), zw'(z); z),
\end{align*}
\]

where \( \Phi(r, s; z) = (p - \alpha)[s + r] + p. \)

For all real \( x, y \) satisfying \( y \leq -n(1 + x^2)/2 \), we have

\[
\begin{align*}
\text{Re} \Phi(ix, y; z) &= \text{Re} \{(p - \alpha)[y + ix] + p\} \\
&\leq -\frac{n}{2}(p - \alpha)(1 + x^2) + p \\
&\leq -\frac{n}{2}(p - \alpha) + p \\
&= p \left(1 - \frac{n}{2}\right) + \frac{n}{2} \alpha.
\end{align*}
\]

Let \( \Omega = \{w: \text{Re} w > p(1 - \frac{n}{2}) + \frac{n}{2} \alpha \} \). Then \( \Phi(w(z), zw'(z); z) \in \Omega \) and \( \Phi(ix, y; z) \notin \Omega \) for all real \( x \) and \( y \leq -n(1 + x^2)/2, \ z \in U. \)

By using Lemma 2, we have \( \text{Re} w(z) > 0 \), which implies that

\[
\text{Re} \left\{ \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right\} > \alpha, (0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < p; p, n \in \mathbb{N}),
\]

and hence \( f(z) \in B(\gamma, \beta, p, \alpha) \).

By setting \( \gamma = \beta = 0 \) in Theorem 6, we have following corollary.

**Corollary 7.** If \( f \in A(p) \) satisfies

\[
\text{Re} \left\{ \frac{zf'(z)}{f(z)} \left( 2 + \frac{zf''(z)}{f'(z)} - \frac{zf'(z)}{f(z)} \right) \right\} > p \left(1 - \frac{n}{2}\right) + \frac{n}{2} \alpha
\]

(0 \leq \alpha < p; p, n \in \mathbb{N}),

then \( f(z) \in S^*(p, \alpha). \)

Its further case when \( \alpha = 0 \) and \( p = 1 \), Corollary 7 reduces to Corollary 8.
Corollary 8. If \( f \in \mathcal{A} \) satisfies
\[
\Re \left\{ \frac{zf''(z)}{f'(z)} \left( 2 + \frac{zf''(z)}{f'(z)} - \frac{zf'(z)}{f(z)} \right) \right\} > 1 - \frac{n}{2}
\]
then \( f(z) \in \mathcal{S}^p \).

By taking \( \gamma = 0, \beta = 1 \) in Theorem 6, we have the following corollary.

Corollary 9. If \( f \in \mathcal{A}(p) \) satisfies
\[
\Re \left\{ \frac{(zf''(z))'}{f'(z)} \left( 1 + \frac{zf''(z)}{zf''(z) + f'(z)} - \frac{zf'(z)}{f'(z)} \right) \right\} > p \left( 1 - \frac{n}{2} \right) + \frac{n}{2} \alpha
\]
\[
(0 \leq \alpha < p; p, n \in \mathbb{N}),
\]
then \( f(z) \in \mathcal{K}(p, \alpha) \).

A further case of Corollary 9, when \( \alpha = 0, p = 1 \) gives the following corollary.

Corollary 10. If \( f \in \mathcal{A} \) satisfies
\[
\Re \left\{ \frac{(zf''(z))'}{f'(z)} \left( 1 + \frac{zf''(z)}{zf''(z) + f'(z)} - \frac{zf'(z)}{f'(z)} \right) \right\} > 1 - \frac{n}{2}
\]
\[
(\in \mathbb{N}),
\]
then \( f(z) \in \mathcal{K} \).

Theorem 11. Let \(-1 < b < a \leq 1, 0 \leq \alpha < p, p \in \mathbb{N} \) such that \( p(1 + \alpha) + a \leq 2p(p - b) + b \). If \( G_{\beta, \gamma}(z) \) satisfies the inequality
\[
\left| 1 + \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} - \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right| < \frac{p(a + b)}{(p + a)(p - b)} \quad (z \in \mathbb{U}),
\]
then \( f(z) \in \mathcal{B}(\gamma, \beta, p, \alpha) \).

Proof. Define a function \( w(z) \) by
\[
\frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} = \frac{p + aw(z)}{p - bw(z)} \quad (z \in \mathbb{U}).
\]

Then \( w(z) \) is analytic in \( \mathbb{U} \) and \( w(0) = 0 \). By the logarithmic differentiation of (5), we get
\[
1 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - \frac{zG''_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} = \frac{p(a + b)zG'(z)}{(p + aw(z))(p - bw(z))}.
\]

Now suppose that there exists \( z_0 \in \mathbb{U} \) such that
\[
\max_{|z|<|z_0|} |w(z)| = |w(z_0)| = 1,
\]
Some Subclasses of P-Valent Analytic Functions

Theorem 12. Let \( f(z) \in A(p) \). If \( G_{\beta, \gamma}(z) \) satisfies any of the following conditions:

\[
\left| 1 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - \frac{z_0G''_{\beta, \gamma}(z_0)}{G'_{\beta, \gamma}(z_0)} \right| = \left| \frac{p(a + b)ke^{i\theta}}{(p + ae^{i\theta})(p - be^{i\theta})} \right| \geq \frac{p(a + b)}{(p + a)(p - b)}.
\]

This contradicts our assumption (4). Therefore \( |w(z)| < 1 \) holds true for all \( z \in \mathbb{U} \). Thus we conclude from (5) that

\[
\left| \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} - p \right| = \left| \frac{p + aw(z)}{p - bw(z)} - p \right| < \frac{p + a - p(p - b)}{p - b} \leq p - \alpha \quad (z \in \mathbb{U}),
\]

which implies that \( f(z) \in B(\gamma, \beta, p, \alpha) \).

Theorem 12. Let \( f \in A(p) \). If \( G_{\beta, \gamma}(z) \) satisfies any of the following conditions:

\[
\left| 1 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right| < \frac{p - \alpha}{2p - \alpha},
\]

\[
\left| \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \left( 1 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right) \right| < p - \alpha,
\]

\[
\left| 1 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} \right| = \left| \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} - 1 \right| < \frac{p - \alpha}{(2p - \alpha)^2},
\]

\[
\left| \frac{1 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - p}{\frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} - p} - 1 \right| < \frac{1}{(2p - \alpha)},
\]

\[
\text{Re} \left\{ \frac{zG'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \left( 1 + \frac{zG''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - p \right) \right\} < 1,
\]

\[
(0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < p; p \in \mathbb{N}),
\]

then \( f(z) \in B(\gamma, \beta, p, \alpha) \).
Some Subclasses of P-Valent Analytic Functions

\[ \frac{zG''_{\beta,\gamma}(z)}{G'_{\beta,\gamma}(z)} = p + (p - \alpha)w(z), \quad 0 \leq \gamma \leq \beta \leq 1; \quad 0 \leq \alpha < p; \quad p \in \mathbb{N}, \]  

(12)

then the function \( w(z) \) is analytic in \( U \), and \( w(0) = 0 \).

It follows from (12) that

\[ 1 + \frac{zG''_{\beta,\gamma}(z)}{G'_{\beta,\gamma}(z)} - \frac{zG'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} = \frac{(p - \alpha)zw'(z)}{p + (p - \alpha)w(z)}. \]

(13)

Hence, from (12) and (13), we have

\[ \frac{zG_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} \left( 1 + \frac{zG''_{\beta,\gamma}(z)}{G'_{\beta,\gamma}(z)} - \frac{zG'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} \right) = (p - \alpha)zw'(z), \]

(14)

\[ \frac{1 + \frac{zG''_{\beta,\gamma}(z)}{G'_{\beta,\gamma}(z)} - \frac{zG'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)}}{1 - \frac{1}{w(z)}} = \frac{1}{p + (p - \alpha)w(z)}, \]

(15)

and

\[ \frac{zG'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} \left( \frac{1 + \frac{zG''_{\beta,\gamma}(z)}{G'_{\beta,\gamma}(z)} - \frac{zG'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)}}{1 - \frac{1}{w(z)}} \right) = \frac{zw'(z)}{w(z)}. \]

(16)

(17)

Now, suppose there exists \( z_0 \in U \) such that

\[ \max_{|z|<|z_0|} \left| w(z) \right| = \left| w(z_0) \right| = 1, \]

then from Lemma 1, we have (2). Therefore, letting \( w(z_0) = e^{i\theta} \) in each of (13)-(17), we obtain that

\[ \left| 1 + \frac{z_0G''_{\beta,\gamma}(z_0)}{G'_{\beta,\gamma}(z_0)} - \frac{z_0G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} \right| = \left| \frac{(p - \alpha)ke^{i\theta}}{p + (p - \alpha)e^{i\theta}} \right| \geq \frac{p - \alpha}{2p - \alpha}, \]

\[ \left| \frac{z_0G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} \left( 1 + \frac{z_0G''_{\beta,\gamma}(z_0)}{G'_{\beta,\gamma}(z_0)} - \frac{z_0G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} \right) \right| = \left| (p - \alpha)ke^{i\theta} \right| \geq (p - \alpha), \]
Some Subclasses of P-Valent Analytic Functions

which contradict our assumption (7)-(11), respectively. Therefore $|w(z)| < 1$ holds true for all $z \in \mathbb{U}$. From (12), we have

$$\left| \frac{z G''_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} - p \right| = |(p - \alpha)w(z)| < (p - \alpha), \quad (0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < p; p \in \mathbb{N}),$$

which implies that

$$\text{Re} \left\{ \frac{z G'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right\} = \text{Re} \left\{ \frac{\beta \gamma z^3 f'''(z) + (2\beta \gamma + \beta - \gamma)z^2 f''(z) + zf'(z)}{\beta \gamma z^2 f''(z) + (\beta - \gamma)zf'(z) + (1 - \beta + \gamma)f(z)} \right\} > \alpha,$$

$(0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < p; p \in \mathbb{N}),$

and hence $f(z) \in B(\gamma, \beta, p, \alpha)$.

**Remark 1.** By taking $\gamma = 0; \gamma = \beta = 0; \gamma = 0$ and $\beta = 1; \gamma = \beta = \alpha = 0$ and $p = 1; \gamma = \alpha = 0$ and $\beta = p = 1$ in Theorem 12, we get the results of Irmak and Raina [3, Theorem 1, Corollary 1-4].

**Theorem 13.** Let $0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < 1, \delta$ be a complex number, $\text{Re} \delta \geq \frac{3 - 2\alpha}{2 - \alpha}$ and $\lambda$ be a complex number which satisfies the inequality

$$|\lambda| \leq 1 - \frac{3 - 2\alpha}{\text{Re} \delta(2 - \alpha)}. \quad (18)$$

If $F_{\beta, \gamma}(z) := \frac{z G'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)}$ is regular in $\mathbb{U}$ and
Some Subclasses of P-Valent Analytic Functions

Hence, from (19) and (22), we have

\[
\left| 1 + \frac{z G''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - \frac{z G'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right| \leq \frac{1 - \alpha}{2 - \alpha} \quad (z \in \mathbb{U}),
\]

then the function

\[
F(z) = \left( \delta \int_0^z \frac{t^{\delta-1} G'_{\beta, \gamma}(t)}{G_{\beta, \gamma}(t)} \, dt \right)^{1/\delta}
\]

is univalent in \(\mathbb{U}\).

Proof. Define a function

\[
h(z) = \int_0^z \frac{F_{\beta, \gamma}(t)}{t} \, dt,
\]

then we have \(h(0) = h'(0) - 1 = 0\). Also a simple computation yields \(h'(z) = \frac{F_{\beta, \gamma}(z)}{z}\) and

\[
\frac{zh''(z)}{h'(z)} = \frac{z F'_{\beta, \gamma}(z)}{F_{\beta, \gamma}(z)} - 1.
\]

From (21), we have

\[
\left| \frac{zh''(z)}{h'(z)} \right| \leq \left| \frac{z F'_{\beta, \gamma}(z)}{F_{\beta, \gamma}(z)} \right| + 1
\]

\[
= 1 + \left| \frac{z G''_{\beta, \gamma}(z)}{G'_{\beta, \gamma}(z)} - \frac{z G'_{\beta, \gamma}(z)}{G_{\beta, \gamma}(z)} \right| + 1.
\]

Hence, from (19) and (22), we have

\[
\left| \frac{zh''(z)}{h'(z)} \right| \leq \frac{3 - 2\alpha}{2 - \alpha}.
\]

Using (23), we have

\[
\left| \lambda \left| z \right|^{2\delta} + \left( 1 - \left| z \right|^{2\delta} \right) \frac{zh''(z)}{h'(z)} \right| \leq \left| \lambda \right| + \left| \frac{zh''(z)}{h'(z)} \right|
\]

\[
\leq \left| \lambda \right| + 1 + \frac{3 - 2\alpha}{2 - \alpha} \Re \delta.
\]

Again using (18), we have

\[
\left| \lambda \left| z \right|^{2\delta} + \left( 1 - \left| z \right|^{2\delta} \right) \frac{zh''(z)}{h'(z)} \right| \leq 1.
\]

Applying Lemma 3, we obtain that the function \(F(z)\) defined by (20) is univalent in \(\mathbb{U}\).

We obtain Theorem 14 below, by using Lemma 4 and the same techniques as in the proof of Theorem 13.
Theorem 14. Let $\delta$ be a complex number, $\text{Re} \, \delta > 0$, $\lambda$ a complex number, $|\lambda| < 1$, and $f \in A$. If

$$\left| 1 + \frac{zG''_{\beta,\gamma}(z)}{G''_{\beta,\gamma}(z)} - \frac{zG'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} \right| \leq \frac{1 - \alpha}{2 - \alpha} \quad (z \in \mathbb{U}; 0 \leq \gamma \leq \beta \leq 1; 0 \leq \alpha < 1),$$

then for any complex number $\eta$,

$$\text{Re} \, \eta \geq \text{Re} \, \delta \geq \frac{3 - 2\alpha}{(1 - |\lambda|)(2 - \alpha)},$$

the integral operator

$$F_\eta(z) = \left( \eta \int_0^z t^{\eta-1} \frac{G'_{\beta,\gamma}(t)}{G_{\beta,\gamma}(t)} \, dt \right)^{1/\eta}$$

is in the class $S$.

Theorem 15. Let $p(z)$ be an analytic function in $\mathbb{U}$, $p(z) \neq 0$ in $\mathbb{U}$ and suppose that

$$\left| \arg \left( p(z) + \frac{z^2G'_{\beta,\gamma}(z)}{G_{\beta,\gamma}(z)} \right) \right| < \frac{\pi}{2} \alpha \quad (z \in \mathbb{U}),$$

where $0 < \alpha < p, 0 \leq \gamma \leq \beta \leq 1$ and $f(z) \in B(\gamma, \beta, p, \alpha)$, then we have

$$|\arg(p(z))| < \frac{\pi}{2} \alpha \quad (z \in \mathbb{U}).$$

Proof. Suppose there exists a point $z_0 \in \mathbb{U}$ such that

$$|\arg(p(z))| < \frac{\pi}{2} \alpha, \quad \text{for } |z| < |z_0|, \quad |\arg(p(z_0))| = \frac{\pi}{2} \alpha.$$

Then, applying Lemma 4, we have

$$\arg \left( p(z_0) + \frac{z_0^2G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} \right) = \arg \left( p(z_0) \left( 1 + \frac{z_0G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} \right) \right) + \arg \left( 1 + i \frac{z_0G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} k_\alpha \right).$$

When $\arg(p(z_0)) = \pi \alpha / 2$, since

$$\text{Re} \left( \frac{z_0G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} k_\alpha \right) > 0 \Rightarrow \arg \left( 1 + i \frac{z_0G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} k_\alpha \right) > 0,$$

Eq. (25) becomes

$$\arg \left( p(z_0) + \frac{z_0^2G'_{\beta,\gamma}(z_0)}{G_{\beta,\gamma}(z_0)} p'(z_0) \right) > \frac{\pi}{2} \alpha.$$

Notes
Similarly, if \( \text{arg}(p(z_0)) = -\pi \alpha /2 \), since
\[
\text{Re} \left( \frac{z_0 G'_{\beta, \gamma}(z_0)}{G_{\beta, \gamma}(z_0)} k \alpha \right) < 0 \Rightarrow \text{arg} \left( 1 + i \frac{z_0 G'_{\beta, \gamma}(z_0)}{G_{\beta, \gamma}(z_0)} k \alpha \right) < 0,
\]
we obtain that
\[
\text{arg} \left( p(z_0) + \frac{z_0^2 G'_{\beta, \gamma}(z_0)}{G_{\beta, \gamma}(z_0)} p'(z_0) \right) = \text{arg}(p(z_0)) + \text{arg} \left( 1 + i \frac{z_0 G'_{\beta, \gamma}(z_0)}{G_{\beta, \gamma}(z_0)} k \alpha \right) < -\frac{\pi}{2} \alpha.
\]
(27)

Thus, we see that (26) and (27) contradict our assumption (24). Consequently, we conclude that
\[
|\text{arg}(p(z))| < \frac{\pi}{2} \alpha \quad (z \in \mathbb{U}).
\]
