Knowledge and Attitude of Legal Service Providers towards Rape Victim of Girls and Women: The Case of Wolaita Zone, SNNPR, Ethiopia

By Bereket Tessema Zewude, Kidus Meskele Ashine & Abebayehu Tora Kacho
Wolaita Sodo University

Abstract- An attempt has been made to observe knowledge and attitude towards legal service providers of the victim of rape. The objective of the study was to assess knowledge and attitude towards legal service providers of rape victims in study area. Regarding the knowledge and attitude of the legal service providers, 89.5% defined rape as a forced penetration of vagina with penis while less than half considered forced anal and mouth penetration with penis as rape. Majority legal service providers have bad attitude towards rape victims. On the other hand, the majority of respondents literally indicated that they would reject the case of the compliant, if the victim willingly went to the suspect's house (48.4%), if the victim couldn't provide enough eye witness (56.4%), if there is no medical proof and other exhibit available (89.8%), and if the suspect is husband to the victim (42.5%).

Keywords: *attitude, ethiopia, legal service providers, knowledge, rape, wolaita zone.*

Knowledge and Attitude of Legal Service Providers towards Rape Victim of Girls and Women: The Case of Wolaita Zone, SNNPR, Ethiopia

Bereket Tessema Zewude [α], Kidus Meskele Ashine [σ] & Abebayehu Tora Kacho [ρ]

Abstract- An attempt has been made to observe knowledge and attitude towards legal service providers of the victim of rape. The objective of the study was to assess knowledge and attitude towards legal service providers of rape victims in study area. Regarding the knowledge and attitude of the legal service providers, 89.5% defined rape as a forced penetration of vagina with penis while less than half considered forced anal and mouth penetration with penis as rape. Majority legal service providers have bad attitude towards rape victims. On the other hand, the majority of respondents literally indicated that they would reject the case of the compliant, if the victim willingly went to the suspect's house (48.4%), if the victim couldn't provide enough eye witness (56.4%), if there is no medical proof and other exhibit available (89.8%), and if the suspect is husband to the victim (42.5%). The findings in this study indicate that rape victims in Wolaita Zone have higher chance of being rejected after involvement in the legal process not merely due the less admissibility of the cases before the court, but the influence of legal and extralegal factors that come into play through shrinking the chance of believability among prosecutors and judges which could indicate their knowledge and attitude towards rape victim. Also, there is no statistical association between knowledge and attitude of legal service providers with sex, age, education level, professional background and job profile. Hence, introducing standardized, internationally acknowledged, and locally adoptable rape case management procedures, providing up-to-date and sustainable trainings to the judges and public prosecutors are highly recommended to realize justice to the rape victims.

Keywords: attitude, ethiopia, legal service providers, knowledge, rape, wolaita zone.

I. Introduction

a) The situation of rape in Ethiopia

In Ethiopia, various studies indicated the prevalence of gender based violence in general and sexual violence in particular. A study among high school students revealed that girls are even denied their freedom of movement and are afraid of moving or walking alone in broad day light even in the streets of big cities like Addis Ababa and of the 6.2% of the students who have started sexual intercourse, 26.1% were raped cases and 75.9% of the students reported being sexually harassed (Lelisa & Yusuf, 2008). School based cross sectional survey conducted in Debark, north western Ethiopia also indicated the prevalence of completed and attempted rape to be 8.8% and 11.5% respectively (Worku et al., 2002). In a cross sectional survey conducted in Addis Ababa University among 612 female students, the prevalence of lifetime completed and attempted rape was 12.7 % and 27.5% respectively while sexual harassment in lifetime and 12 month period accounted 58% and 41.8% respectively (Tadesse, 2004). A study conducted in Hawassa University recorded the overall prevalence of gender based violence among 1330 female students and found 59.9% lifetime, 46.1% since enrolling college and 40.3% current academic year (Dodie et al., 2008).

Though there is paucity information in Ethiopia, a number of cross sectional studies recorded sexual violence particularly rape as the most common problem for women and girls. However, large number of rape and sexual assault cases remains under reported to authorities because of complex socio cultural and institutional reasons. Even when reported, the rate of charges and conviction are less likely. Among the major reasons identified in other settings, institutional constraints related to laws and procedures of rape, and knowledge, attitude and beliefs of legal service providers about sexual violence play an important role in determining the reporting and prosecution process of rape. This study therefore intended to identify constraints faced by girls and women after their involvement in the legal process. In our case we tried to explore the knowledge and attitude of legal service providers of rape victim in wolaita zone, Ethiopia.

II. Methodology

a) Description of study area

The study was carried out in Wolaita Zone, Ethiopia year of 2013. Wolaita Zone consists of 13

woredas found in temperate region of South Nationalities and Peoples (SNNP) regional state with capital town of Sodo. Sodo town is located (54^0N latitude and 380^0 S longitude) and 396km south of Addis Ababa and 130km from regional town Hawassa.

b) Study Design

The research design was qualitative as well as quantitative research design can be employed.

c) Source of Population

The source of population consists of 12 woredas and 3 admistrative towns legal service providers found in wolaita zone for study purpose.

d) Sampling Technique

Among 12 Woredas and 3 administrative towns we take a sample of 6 woredas and 1 administrative towns using purposive sampling technique.

e) Variables Identification

For study purpose our dependent variables includes: knowledge and attitude towards legal service providers.

f) Independent Variables

Socio-demographic variables.

g) Data Collection

Both primary and secondary data collection method were applied to get the desired information. Primary data were collected through a questionnaire. The questionnaire was prepared, pre tested and administered for the selected woredas and administrative towns.

h) Data Entry and Analysis

Data entry and cleaning were carried out using statistical soft ware package SPSS version 22.0 for the analysis. The analysis employed here is that descriptive statistics analysis was used to show the frequency distribution and its results were presented by tables. Also chi-square result was used.

III. Results and Discussion

Table 1: Respondents' knowledge and Attitude of rape

Variables	Category	Yes		No	
		Frequency	Percent	Frequency	Percent
Conditions of rape	When forced penetration of vagina with penis is made	246	89.5	19	6.90
	When forced penetration of anus with penis is made	97	35.5	168	61.1
	When forced penetration of mouth with penis is made	132	48.0	133	48.4
	I don't know	262	3.5	305	96.5
	Not willing to answer	2	0.7	263	95.6
Categorization of rape victims	When wife or husband complains that she or he has been forced to make sex without consent	147	42.5	155	56.4
	When a girl has been forced to make sex without consent	253	92.0	19	6.90
	When a boy has been forced to make sex without consent	158	57.5	113	41.1
	When adult women have been forced to make sex without consent	202	73.5	70	25.5
	When adult men have been forced to make sex without consent	121	44.0	151	54.9
Type of rape legal service providers must take it seriously	Rape committed by marriage partner	46	16.7	228	82.9
	Rape committed against child girls and young women	268	97.5	6	2.2
	Rape committed against child boys and young men	106	38.5	168	61.1
	Rape committed against adult women	160	58.2	114	41.5
	Rape committed against adult men	60	17.1	205	82.5

Based on table 1, the result indicates that most of the participants i.e. 89.5% defined rape as a forced penetration of vagina with penis. Below half of the participants considered forced anal and mouth penetration with penis as rape. When asked to categorize the rape victims, the large majority considered rape victimization of girls and adult women constituting 92 % and 73% respectively. Nearly 40% of

© 2017 Global Journals Inc. (US)

the respondents considered marital rape and rape against adult men. 97.5% and 58.2% of the respondents indicated that rape against child girls and adult women respectively must be taken seriously among the legal service providers (we can't conclude based on descriptive statistics). Only 38.5% of the respondents considered rape against child boys.

Table 2: Chi square result

Variables		Knowledge and Attitude towards rape victims(Bad and Good)	
Variables	Total	χ^2	p-value
Sex: Male Female	154(40.84%) 221(58.6%)	42.44	0.36
Age: 18-21 years Greater than 21 years	196(51.98%) 168(48.02%)	1343.3	0.363
Level of education: Diploma Degree Masters Others	77(20.42%) 150(39.78%) 115(30.5%) 35(9.28%)	152.2	0.601
Professional background	154.1		0.993
Job profile	4154.0		0.693

The average score of respondents on the Attitude towards Rape Victim's Scale is 39.97 while the minimum and maximum scores are 0 and 78 respectively. Majority of the respondents have rated their attitude on the 25 items scale above the average i.e. 54.2%. This implies that most of the legal service providers tend to accept the rape might and have relatively bad attitude towards rape victims. Interestingly, there is no statistically significant association in knowledge and attitude of legal service providers across sex ($\chi^2 = 42.44, p = 0.36$), age ($\chi^2 = 1343.3, p = 0.363$), level of education ($\chi^2 = 152.2, p = 0.60$), professional background ($\chi^2 = 154.1, p = 0.993$) and job profile ($\chi^2 = 4154.0, p = 0.691$).

IV. Conclusions

- Based on chi-square result there is no statistically significant difference in knowledge and attitude of legal service providers across sex, age, educational level, professional background and job profile.
- Based on descriptive result most of the respondents' defined rape as a forced penetration of vagina with penis. Below half of the participants considered forced anal and mouth penetration with penis as rape in line with their knowledge and attitude towards rape victims.

Global Trends of Animal Ethics and Scientific Research

Manshu Jain [α], Ritu Gilotra [σ] & Jitendra Mital [ρ]

Abstact- This article deals with global trends and guidelines followed by different countries in scientific research. The various objectives of animal research, pros and con and alternative method for animal research by the use of 3Rs are disused here it is felt that however animal research is indispensible in several research but in certain alternative are alternately effective means of animal rights. This article reviews various aspects which are related to this issue.

Keywords: *animal models, ethics, guideline, cons.*

I. Introduction

Humans have benefited from research involving animals, in every medical achievement in the past century. Developments in the many treatments such as diabetes, leukaemia and heart surgery transplantshave been possible through the use of animals in research. The majority of the scientific community consider that the use of animals in research justified.The public also now accepts the use of animals in research due to the following reasons:

- They believe now there is no unnecessary suffering to the animals;
- The research is for serious medical or life-saving purposes;

There is no reliable and informative alternative to their use. It is important to recognise that work on animals in research, whose benefits to health and in treatment ofdisease are not evidenced firstly.This is highly useful as it provides or gives the groundwork or basic structure for medical advances. The moral for animal's research should be tominimise animal suffering and maximise the benefits to medicine, health, agriculture and fundamental understanding of body.

Animal research only takes place within a framework of robust controls. UK legislation requires refining the procedure to keep the minimum suffering of animals, and the use of animals should be that much only which gives meaningful results and the use of animals with non-animal alternatives methods is also appropriate. However, sometimes the use of non-animal methods may not be useful for some types of research. The majority of research using animals is about 84% in which the rodents are important subject for the experiment. Basic research and drug development for 82% of all procedure is safely performed comparing to the remaining 18% research. [13, 14, 15].

The use of animals in research can be alternative research method evidence that research by using animal is unnecessary. Non-animal methods, such as tissue culture, computer modelling, research using human test subjects and population studies, are used and have utility for scientific and medical research. All the research guidelines which are for animal welfarehad very high value for scientific and medical understanding. This is because a research study sometime needs more than knowing how individual molecules, cells or tissues behave, but then too it is unethical and illegal to expose human or animal new medicines knowing that it is benefited or not, so the only alternative method is useful for study of the new entity for health improvement and for treatment of diseased condition. The guidelines which work for animal welfare or for ethical research on animal give the many guidelines on the different level such as Royal Society for animals welfare they give numerous bodies, including government departments, funding agencies, charities and discussion meetings [16, 17].

II. Pros and Cons for Animals

Animals are essential for research which is use in cures and treatments of diseases that affect human. A better life and health is found by the experiment on the animals, but with this good thing comes a bad one too that is experiment on animals some time which lead to chronic toxicity or death of the animal. There are many people and community who opposing the use of animals in experiments by claiming it as non-ethical way to have anexperiment on animals.

This section helps us to know the pros and cons of animal in research:

Pros [1]:

- Animal testing is useful as it contribute in life-saving by cures and treatments in human.

  CASE STUDY: The California Biomedical Research Association states that nearly every medical breakthrough in the last 100 years has resulted directly from research using animals. Experiments in which dogs had their pancreases removed led directly to the discovery of insulin, critical to saving the lives of diabetics.

- Animal research has also contributed to major advances in understanding and treating conditions such as breast cancer, brain injury, childhood leukaemia, cystic fibrosis, malaria, tuberculosis, leprosy, blood cancer, insulin and many others, and in the instrumental development of pacemakers, cardiac valve substitutes, and anaesthetics.
- Much research cannot be possible without animal studies.

  FOR EXAAMPLE: "we wouldn't have a vaccine for hepatitis B without chimpanzees",a disease that kills more than 14,000 people every year in the United States.
- Animals are always used when ethical considerations prevent the use of human subjects, the lives of human volunteers and patient cannot be put in danger unnecessarily. The World Medical Association Declaration of Helsinki states that human trials should be preceded by tests on animals.
- It will be very unethical to perform experimental procedures on human beings before tested on animals, such as in the genetic manipulation experiment to directly impose on human subjects before animal testing.
- Animals themselves get benefit from the results of animal testing, such as if vaccines were not tested on animals, millions of animals would have died from rabies, distemper, feline leukaemia, infectious hepatitis virus, tetanus, anthrax, and parvo virus.
- Animal research is highly regulated, with laws and guidelines to protect the animals in laboratory and research by mistreatment. Such as Animal Welfare Act (AWA) since 1966, these give minimum housing standards for research animals and also work for regular inspections by veterinarians.
- Animal researchers treat animals humanely, both for the animals sake and to ensure reliable test results which will be helpful for human too, as all experiment perform under approval of by an Institutional Animal Care and Use Committee (IACUC)
- Commercially VS Research use of animal.

  Example: 1. People in the US eat more than 9 billion chickens and 150 million cattle, pigs and sheep annually, as compare to them only 26 million animals are used for research, in which 95% of which are rodents, birds and fish. As compare to them we eat more than 1,800 times the number of pigs than the number used in research.

Similarly, the use of animal in leather preparation is more than the animal use in research it is approximately more than 15% as compare to research.

Cons [1]

- Animal testing is cruelty of the human for the animals. As the animal is forced for feeding, forced inhalation, food and water deprivation, prolonged periods of physical restraint, fasting for long period of time, and give them the infliction of burns and other wounds to study the healing process, the infliction of pain to study its effects and remedies, and "killing by carbon dioxide asphyxiation, neck-breaking, decapitation, or other means."
- Is really an inhuman behaviour by human towards the animal?

  FOR EXAMPLE: The Draize eye test, is another method used by cosmetics companies to evaluate irritation caused by shampoos and other products, in this the rabbits being incapacitated in stocks with their eyelids held open by clips, sometimes this test take the long-time not only hours but days too, so they cannot blink the eyes during products testing.
- During LD50 the animal was killed to test the toxicity they were sacrificed after the experiment due to severe condition happened during experiment.

  CASE STUDY: The US Department of Agriculture (USDA) reported in 2010 that 97,123 animals suffered pain during experiments while being given no anaesthesia for relief, including 1,395 primates, 5,996 rabbits, 33,652 guinea pigs, and 48,015 hamsters, is this correct with animal?
- Alternative testing methods can be used to replace the need for animals. Drugs that pass animal tests are not necessarily safe.

  CASE STUDY 1: The 1950s sleeping pill thalidomide, which caused 10,000 babies to be born with severe deformities, was tested on animals prior to its commercial release. Later tests on pregnant mice, rats, guinea pigs, cats, and hamsters did not result in birth defects unless the extremely high dose of drug was administered.

  CASE STUDY 2: Animal tests on the arthritis drug Vioxx showed that it had a protective effect on the hearts of mice, yet the drug went on to cause more than 27,000 heart attacks and sudden cardiac deaths before being pulled from the market.
- 95% of animals used in experiments are not protected by the Animal Welfare Act.

  SUCH AS, Animal Welfare Act does not cover rats, mice, fish and birds, which comprise around 95% of the animals, used in research they, are small or not necessary as animal what the reason?
- The Animal Welfare Act has not succeeded in preventing horrific cases of animal abuse in research laboratories.

  CASE STUDY: In Mar. 2009, the Humane Society of the United States (HSUS) found 338 possible violations of the Animal Welfare Act at the federally

© 2017 Global Journals Inc. (US)

funded New Iberia Research Centre (NIRC) in Louisiana.

- Medical animal research may still have been made without the use of animals but, there is no enough money and resources to use the alternative method, for this the community working for animal welfare and common people should take the action by participating in the animal welfare issue.
- *Statements from Animal Rights Extremist Groups are as follow:*

  "I don't think you'd have to kill too many [researchers]. I think for five lives, 10 lives, 15 human lives, we could save a million, 2 million, 10 million non-human lives."

  –Jerry Vlasak, spokesperson for SHAC and ALF

  "In a war you have to take up arms and people will get killed, and I can support that kind of action by petrol bombing and bombs under cars, and probably at a later stage, the shooting of vivisectors on their doorsteps. It's a war and there's no other way you can stop vivisectors."

  –Tim Daley, ALF

III. Why use Animals in Research?

The experiment on animal is due to several reasons:

- First, in some research by studying animal behaviour, we can gain an understanding of human behaviour.
- In a similar manner by understanding the impact of different or many environmental factors such as crowding, cognitive stimulation, enrichment, or deprivation on animal behaviour, by this we understand how these environmental factors affect human behaviour.

  FOR EXAMPLE: The work of Harlow and Zimmerman (1959), In their experiment, infant monkeys was separated from their mothers and kept under two different surrogate conditions; in one condition thesurrogate "mother" was constructed of wire with a wooden head, while in the other condition the wire was covered with terry cloth to provide softness and warmth. The experimenters were interested in seeing whether the primary function of attachment to the mother was simply for survival as she provides food. What the studies found was that, regardless of which "mother" provided the food, the baby monkeys spent more time clinging to the terry cloth "mother." By this experiment they concluded that attachment is not merely for survival (food) but for contact comfort: something warm and soft to cling. However, the studies also found that, regardless of which type of surrogate the monkeys had, all developed problems later on. They were either inappropriately aggressive or timid, and the females tended to neglect or abuse their own young. Can we conclude from this study that attachment between human infants and their mothers also goes beyond the simple need for food and survival? In other words, we can say the findings of the Harlow et al. studies to human children and hypothesize that a lack of opportunity for contact comfort, or attachment, will also have an adverse effect on human development? The studies conducted by Harlow et al., for example, could not have used human participants for obvious ethical reasons.
- Many of the drug and treatment was developed through the use of animal research are used and it also help in the treatment of animals themselves.

  EXAMPLE: Diseases such as tuberculosis, scarlet fever, and polio, not to mention high blood pressure, would continue to claim millions of lives. In addition, According to Perkins, 90% of the animals used in research are rats, mice, and fish, and are bred solely for research purposes.
- Misguided attempts on animals can also have tragic consequences for the animals themselves.

  FOR EXAMPLE: In a recent attack on the animal research laboratory at the University of Minnesota, the animals were "liberated" and set free on a field near the school. Many of the animals were found wandering by the road, hardly a safe environment for animals, and several of the stolen rats were found dead.
- On the basis of this type of issue, animal research does continue, and it is governed by ethical guidelines for research involving human participants is regulated.

a) Alterative Method to Avoid use of Animal

"ALTERNATIVES" as encompassing any subjects, protocols, or technologies that '(replace the use of laboratory animals altogether, reduce the number of animals required, or refine existing procedures or techniques so as to minimize the level of stress endured by the animal"[4,5].

Example:

- Vitro (in glass) testing, such as studying cell cultures in a petri dish, can produce more relevant results than animal testing on different rodent and non-rodent species because human cells can be used. Micro dosing can be administered to the human who gives the appropriate result on human volunteers, whose blood is then analysed.
- Artificial human skin, such as the commercially available products EpiDerm and ThinCert, can be used as it is made from sheets of human skin cells grown in test tubes or plastic wells which can produce more useful results than testing chemicals on animal skin as some times result varies animal and between human.

© 2017 Global Journals Inc. (US)

The animals use in scientific research is act as tool in improving the understanding of how biological systems work both in health and disease condition. The developments of new medicines are for both humans and animals, and for the protection of our environment. Hence, it was properly regulated by use of animals in improving the health and lives of humans and animals and to the safety and sustainability of our environment.

This research supports the UK's world-class research base on the environmental, agricultural, medical and other life sciences. The alternative method improves health and diseased condition of patients and animals in the UK by the outcomes of research.

National Health Service is the primary source of research and testing on animals – such as by the licensing of new medicines, and the development of new and safe vaccines and for the detection and control of infectious diseases.

For Example:

- The development of monoclonal antibody had completely transformed our ability to treat diseases including breast and other cancers.
- Rheumatoid arthritis and multiple sclerosis treatment was also developed by the use of this technology.

It also supports a number of highly skilled jobs in research on the base of an attractive regulatory environment. Economically the life sciences sector contributes over £50bn a year to the UK economy with agriculture contributing £9bn and it underpins the UK's £26bn sector providing us with healthy and wholesome food.

In 2010, the Government made a commitment to reduce the work on use on animals in scientific research. It encompasses REPLACEMENT, REDUCTION AND REFINEMENT (the 3Rs) more broadly, putting them at the science-led approach.

Implementing of the 3Rs requires in every research proposal, which include:

- Animals are replaced with non-animal alternatives wherever possible,
- The number of animals used is reduced to the minimum needed to achieve the results sought, and
- For those animals which must be used, the procedure should be refined as much as possible to minimise the suffering of animal.

The scientific imperative for developing new approaches to research and development is very strong. Similarly, there are concerns about the utility of animal studies for testing environmental chemicals.

- FOR EXAMPLE, Animals are exposed to too much higher doses than typical human exposures making interpretation difficult.

An international science organisation called for the development of assays that are more predictive to human biology. Attention has focused on non-animal technologies; it include tissue engineering, stem cells, and mathematical modelling [5].

On 18 July 2012, Written Ministerial Statement set our ambition to deliver the commitment such a science-led programme, spearheaded by relevant government departments and agencies, working together where appropriate, and by the National Centre for the Replacement, Refinement and Reduction of Animals in Research (NC3Rs), an organisation with record in promoting the 3Rs in animal research.

Plan demonstrates how taking advantage of technological developments, including increased computer power and wider scientific innovation, to provide the perfect environment and catalyst for scientific change and progress which will help to reduce the use of animals in research. The Delivery Plan set out the Government three strategic by putting the 3Rs at the science-led programme:

- Advancing the use of the 3Rs within the UK;
- Using international leadership to uptake and adoption of 3Rs approaches globally;
- Understanding and awareness about the use of animals where no alternatives exist.

Strategic priorities are considered in detail in Section 2 of this Delivery Plan.

In this Strategy UK Life Sciences was published in 2013 whose aim is to make the UK the location for research and development together for manufacturing. This Delivery Plan shows how 3Rs makes a real contribution to realising benefits for humans, animals, environment and sustained economic growth.

HENCE, for all these above points we use the alternative methods which help to sustain growth of economic, animals and humans and environment too. [6]

3Rs

3Rs is proposed by Charles Hume, founder of the Universities Federation for Animal Welfare (UFAW) in 1954, consideration alternatives was made for animal testing on laboratory animal experiments. R.L. Burch and the zoologist W.M.S. Russell is the microbiologist who publishes the work, "The Principles of Humane Experimental Technique" in London in 1959, and the book also defined the animal testing alternatives as "The Three R's: Refinement, Reduction, and Replacement [7,8]

Laboratory animals are manly used in following areas:

- BIOMEDICAL RESEARCHERS use animals to understand the body metabolism and catabolism, disease and health condition of the body, and to develop new vaccines for treatments of various diseases.
- INDUSTRY uses animals to test the effectiveness and safety of consumer products.

© 2017 Global Journals Inc. (US)

SUCH AS: for drugs, cosmetics, household cleaning products, pesticides, industrial chemicals, and for many more test.

- EDUCATIONAL uses include dissecting earthworms or frogs in biology class which are now rarely used, as well as in advanced training of surgical techniques for veterinary and medical students.
- PSYCHOLOGICAL OR SOCIAL BEHAVIOURS RESEARCH is used for study of animals to learn more about a given species, its biology and behaviour. They may learn from the special skills or abilities of an animal as well such as animal models were used.

  FOR EXAMPLE, Navy researchers have studied dolphin echolocation--their built-in biological sonar system to improve the human-made sonar systems used on board ships. [9]

In the research laboratory an animal may be poisoned; deprived of food, water or sleep; skin and eye irritants were applied; subjected to psychological stress; deliberately infected with disease; brain damaged; paralysed; surgically mutilated; irradiated; burned; gassed; force fed and electrocuted. [10, 11]

Replacement of Animals in Medical Experiments (FRAME) considered that the animal experimentation is unacceptable, but the abolition of all animal in experiment is not possible. New consumer products, medicines, and industrial and agricultural chemicals can be tested in order to identify potential of human and animal health, and to the environment. [10]

Alternative methods fall into three broad categories. These are called the 3 Rs

- Replacement,
- Reduction, and
- Refinement.

Replacement is what most people think of when you say "alternatives to animal testing"

- The animals are replaced, either by methods that don't involve animals at all that are called as absolute replacement.
- By those that use only the cells or tissues of animals that is called as relative replacement.

  SUCH AS: Many replacement alternatives involve in vitro or in glass techniques, where the studies are perform with cells or tissues in culture. If the cells come from human beings, it's absolute replacement, and if from animal it is called as relative replacement. [10]
- Replacement also means replacing 'higher' animals with 'lower' animals.

  SUCH AS: Microorganisms, plants, eggs, reptiles, amphibians, and invertebrates may be replaced by the warm-blooded animals in many experiments.

Live animals may be replaced with non-animal models, i.e. dummies for dissection in teaching the animal or the human body structure, mechanical or computer models, audio-visual aids, or in vitro modelling. [12]

- Replacement utilizes the pre-existing knowledge for new system to look similarities and for using less expensive animals or models to have research on agents for toxicity or mutagenicity. [10]
- Disadvantages for replacement is that if any model are dependent on pre-existing information, the complex physiology and pathology of organism was not known. Hence, research on new biological processes must utilize a living organism; unfortunately, replacement isn't always an option. [12,10]
- EXAMPLE OF REPLACEMENT: of a replacement alternative is no longer considered an alternative it has become the norm. Not too many years ago, if a woman wanted to find out if she was pregnant, she'd have to get a laboratory test that involved killing a rabbit. Now, she can buy a small kit over-the-counter that tests her urine for certain chemicals the rabbits have been replaced. [10,11]

Reductions mean minimizing or reduce the number of animals needed to perform an experiment or teach a concept.

- In research testing some test cannot perform without animals, at least at this research time. Researchers can also work by reduce the number of animals used in a given study.
- Sometime the uses of far fewer animals are given valid results. These methods include performing pilot studies to determine the potential problems in an experiment before numerous animals are used.
- Designing a study is done by utilizing number of animals by our own control, it include to have a maximum amount of information from each animal, or gathering many or much data from more than one experiment concurrently.
- Statistician consult should be taken for numbers of animals required to achieve significance result during result, or by Minimizing variable condition of animal which affect the result such as, disease, stress, diet, genetics, etc.
- The appropriate species of animal also useful for the data collection, and Replacement should be done whenever it is required or possible. [9, 8, 10]

Refinement means refining experimental protocols to minimize pain or distress to the animal whenever it is possible for the experiment.

- For those animals that do undergo testing, scientists may refine their methods to lessen or eliminate pain, distress, or suffering and to make the animals more comfortable. [10]
- Examples of refinement which include it for the identification pain and distress and making plans and executedfor preventing or relieving it.

© 2017 Global Journals Inc. (US)

- During measuring the toxicity of a compound or survival can be determined not by death just by chronic toxicity.
  SUCH AS: Atumour achieves a certain size; at the time of coursedeath is predictable. Subsequent experiments may beutilized the earlier endpoint of tumour size or clinical signs of toxicity, rather than death as the endpoint.

Refinment Can Be Done By: [8, 10]

- Receiving adequate or proper training for performing a procedure
- By using proper handling technique for animals.
- By ensuring that drug doses are correct and drugs should not expired,
- The performed experiment on the animal is reasonable for that species.
- Usinganalgesicsand anaesthetics for potentially painful procedures.
- Performing surgeries procedures aseptically to prevent infection.
- Performing only a single major survival surgery on any one animal, whenever possible.

IV. Different Alterative Methods

Alternatives to animal use in biomedical and behavioural research fall into four broad categories:

- Continued, but modified, animal use, including a reduction in the number of animals used, improved experimental design and statistical analyses of results, substitution of cold-blooded for warm-blooded vertebrates, substitution of laboratory mammals for domestic or companion mammals, and reduction of pain or experimental insult;
- Use of living systems, including in vitro cultures (of cells, tissues, and organs) embryos, invertebrates, micro-organisms, and plants;
- Use of non-living systems by using chemical or physical systems; and
- Computer simulation.

Biomedical and behaviouralhad focus attention on drug development by using alternatives rather than animal methods. Alternative methods in research show advantages that can be based on the prospect as follow i.e. on scientific, economic, and humane which include including:

- The number of animals used can be reduced;
- Animal pain, suffering, and experimental insult can be minimized;
- Reduction in investigator-induced and art factual physiological phenomena;
- Using the process which provide more quickly result;
- To perform ability for replicative protocols on a routine basis;
- Cost of research reduction;
- Alter conditions for flexibility with experimental protocol;

At the same time, these methods are fraught with inherent disadvantages, including:

- Ability of organismal growth process reduces;
- Ability to study cells, tissues, and organ systems reduces by acting in concert;
- Biochemical and metabolic pathways cannot studies;
- Behaviour study on cell tissue or organ cannot possible;
- Study of recovery of damaged tissue cannot possible;
- Interaction between the organism and its environment ability reduces;
- Decrease ability to study of idiosyncratic or species specific responses;
- Drug effect on male and female-specific phenomena cannot be possible; and Different alternative methods are as follow:

a) Organ Culture

In history of research, investigators have attempted success in every major and minororgan of mammalian body in variety of research purposes. In last few years, techniques were improved, such as artificial blood media system which helps in, successful organ culture. The applications of organ culture include the study of protein synthesis in lactating mammary tissue [21] and by using human placentas in toxicology studies[18].Whole organs are not use in long-term in vitro culture. The complexity of whole organs makes it impossible for nourishment and for normal function of growth without any external support. Cryostat sections of organ are studies into organ-specific test for metastatic tumour cells. These in vivo events reflect the use of whole animals in a very active research area.[20] Whole mammalian embryos are used basic development in biological research and other experiment, which have been cultured in vitro for other purposes. Protocols included the effects of hormones and teratogens [22].

b) Tissue Culture

Tissues from humans and animal species can be studied in tissue culture. The progress have been achieved in 1907, by R.G. Harrison who studied first frog tissue outside the body for weeks, which had changed the tissue culture from an art of science. Bacteria or virus are alive for more than few hours to gain a better result in the antibiotic study. The tissue culture was extended by controlling bacterial contamination. In tissue culture, isolated tissue of a living organism is maintained by various cells which are arranged as they were in the original organism. Tissue cultures are both “better” and “worse” than a single cell type. They act as better in the manipulation in different natural

© 2017 Global Journals Inc. (US)

environment and different cell typeswhich show interaction similar to in vivo, as they are worse in more difficult condition to maintain. Tissue-culture experiment requires animal sacrifice, as they are alternative to numerous sections of animal adjoining tissue to use. By this way, two or more research can be performed in the single animal tissue, rather than a number of individual animals. Tissue culture is successfully used in biomedical research. In neurology, embryonic rat tissues are used to examine the destruction of dopamine neurons [25], which is prior to development, as monkey act as best model for the study of degenerative and the other study to degenerative effect observed in humans.

c) *Cell Culture*

It is not a new technique; development and application of cell culture are seen in many past year in different fields. Cell culture every ethic of biomedical research, as well as in clinical practice.

The approaches of biomedical research by cell culture method are as seen:

- Eggs and sperm of many species are used in the study of fertilization and early development. [28, 19]
- Mutants are used to understand membrane associated proteins which are essential for knowing animal cell function [29].
- In oncology, bacterial recombinant DNA induces in the transformation of white blood cells which is used toobserved infection, cancer, and rheumatoid arthritis [30].
- Steroid metabolism is studied by using rat epididymis cells [31].
- A kidney cell of monkey was use to demonstrate the metabolic effects of many drug [26].
- Surgical research is use to cultured human epitheliums for permanent coverage oflarge burn wounds has moved from the lab- oratory into clinical trials [32].
- In immunology, studies on antibody synthesis and response have been bolstered by the Nobel-prize-winning elucidation of monoclonal antibodies.

Biologists have developed techniques for the controlled disruption of cells that can leave many organelles intact or allow the harvesting of selected intracellular membranes. These fractions have proved to be invaluable in the search for information at the molecular level.

FOR EXAMPLE,

- Microsomal membrane fractions from rat and human liver have been used in comparative anaesthesia research [27].
- The most unique uses of subcellular fractions involves the bringing together of mixed species systems in biochemical studies of protein transport across intercellular membranes.
- Researchers studying intracellular protein translocation used dog pancreatic microsomes, bovine pituitary and rabbit reticulocyte messenger RNA, bacterial nuclease, and a wheat germ cell free system to elucidate the structure of the signal recognition particle [33].

V. Ethical Issue [12, 34, 35]

Many ethical issue works in animal research which are explained in the different issue as quarry with solution:

'Are humans or animal status are different?'

People in large number believe that humans have the high moral status, then animal they believe animals are inferior then humans. However, others disagree and say that this discrimination is having no justification in it. Status of humans and animals can be discussed in following ways:

- One characteristic i.e. self-awareness or rationality.
- Capacity of suffering by animal, which characterised as is an animal's sentience, or to understand its pain, suffering and pleasure.
- Social relationships of animal should also considered, while many animals differ in these characteristics from humans, and also different between animal to animal.

'How can we know how much animals suffer?'

A recent data show that the amount of pain suffered by animals is more as people think; it is very difficult to understand human concepts and emotions about pain, distress, fear, happiness or affection to animal. Even if we can say that animals have similar brain activity as humans, which means pain suffering in the animal is in the same way.

'Can we justify making animals suffer?'

Many people believes that it is wrong to make animal suffer without reason; but some people think that there is some condition more than the interests of people outweigh the interests of an animal, this justify animal suffers more than enough.

In research using animals, the costs, in the form of suffering, are largely experienced by the animals while any benefits arising from the research are largely directed to human patients.

VI. Guidelines for Ethical Research [36, 37, 38, 39]

The UK has regulation on research involving animals worldwide. Law of the Animals are (Scientific Procedures) Act 1986. This law was act to protect animal by cause "pain, suffering, distress or lasting harm" must be licensed. 'Protected' animals include all vertebrates (mammals, birds, reptiles, amphibians and fish, and octopus). All procedures must carry three separate licenses for the premise; the researcher and the project.

© 2017 Global Journals Inc. (US)

a) Licences for Research Involving Animals

i. *Premise Licence*

The place where research is conducted must meet standards of animal housing and care and is regularly subject to inspection by the Animals (Scientific Procedures) Inspectorate. In 1999, there were 296 designated premises in the UK.

ii. *Personal Licence*

Any person conducting animal procedures must be competent to do so and must have completed an accredited training course in order to be awarded a licence. This licence specifies which procedures can be conducted and on which species. In 1999, there were around 13,700 active personal licences in the UK.

iii. *Project Licence*

This defines the types of animals which may be used, the estimated number to be used, and the procedures that may be carried out. The licence application includes details of the purpose of the project, an initial welfare assessment and a limit of severity for each procedure.

In general, project licences should only be granted if:

- The research cannot be done without animals;
- The likely costs of the research are weighted against the potential benefits in a cost benefit assessment, and the benefits are deemed to be greater;
- The minimum number of animals will be used;
- Researchers and technicians are trained and experienced in animal testing;
- Research premises have facilities for animal care.

Inspectors visit laboratories to assess licenceregulations. There are currently 25 inspectors in the UK, who make more than 2,100 in every year. The independent Animal Procedures Committee (APC) was established to advise the Secretary of State on the operation of the 1986 Act.

b) Testing Guidelines

Testing guidelines are developed for a variety of reasons:

- To allow results of various test substances or species to be easily compared,
- To encourage the use of certain protocols so that testing need not be repeated, and
- To facilitate the work of those who design and carry out tests.

Many organizations differently developed their own testing guidelines.

- FDA Guidelines Involving Whole Animal Testing
- OECD Guidelines Involving Whole Animal Testing
- Pesticide Assessment Guidelines Involving Whole-Animal Testing

Ethical guidelines of animal testing are:

- CPCSEA Committee for the Purpose of Control and Supervision on Experiments on Animals
- CARE Community on Animal Research and Ethics
- GCUASR Guidelines For Care And Use Of Animals In Scientific Research
- NACLAR National Advisory Community for Laboratory Animal Research
- APA American Psychological-al Association

Table 1: Different Community Work for the Ethical Guidelines for Animal

	CPCSEA	CARE	GCUASR	NACLAR	APA
Full Form	Committee for the Purpose of Control and Supervision on Experiments on Animals	Community on Animal Research and Ethics	Guidelines For Care And Use Of Animals In Scientific Research	National Advisory Community for Laboratory Animal Research	American Psychological-al Association
Guidelines Followed In Country/ Countries	India	Washington, DC	Indian National Science Academy (India)	Australia, Canada, New Zealand, US	US
GOAL	Guidelines is to promote the humane care of animals used in biomedical and behavioural research and testing with the basic objective of providing specifications that will enhance animal well-being, quality in the pursuit of advancement of biological knowledge tl1at is relevant to humans and animals.	Important parts of these endeavours are teaching and research on the behaviour of nonhuman animals, which contribute to the understanding of basic principles underlying behaviour and to advancing the welfare of both human and nonhuman animals.	The interest of society and the welfare of animals.	Guidelines set out the responsibilities of all the parties involved in the care and use of animals for scientific purposes, in accordance with widely accepted scientific, ethical and legal principles.	The acquisition, care, housing, use, and disposition of nonhuman animals in research must be in compliance with applicable federal, state, and local, laws and regulations, institutional policies, and with international conventions to which the United States is a party.

© 2017 Global Journals Inc. (US)

Table 2: Points Covered in Different Guidelines

CPCSEA	CARE	GCUASR	NACLAR	APA
Veterinary care	Justification of the research	Sources of experimental animals	General principles for the care and use of animals for scientific purposes	Justification of the Research
Animal procurement	Personnel	Laboratory animal husbandry and management	Animal housing and management	Personnel
Quarantine, stabilization and separation	Care and housing of animals	Transport of laboratory animals	Procurement and transport of animals	Care and Housing of Laboratory Animals
Animal care and technical personnel	Acquisition of animals	Anaesthesia and euthanasia	Staff at housing and research facilities	Acquisition of Laboratory Animals
Functional areas	Experimental procedures	Disposal of animal carcasses	Veterinary care	Experimental Procedures
Animal husbandry	Field research	Laboratory animal ethics	Responsibilities of institutions and the institutional animal care and use committees (IACUC)	Field Research
Record keeping	Educational use of animals	Legal provision	Responsibilities of investigators	Educational use of nonhuman animals
Laboratory animal ethics	-	-	Responsibilities of teachers	-

Table 3: Brief Explanation of all the Guidelines

POINTS	CPCSEA	CARE	GCUASR	NACLAR	APA
Veterinary care	Daily observation of animals,	Care should be done according to "American Veterinary Medical Association (AVMA) Panel on Euthanasia."	The post-operative holding rooms, cages and the care should be under the supervision of a qualified veterinarian.	Investigators must have ready access to veterinary care for the animals at all times.	Care should be done according to "American Veterinary Medical Association (AVMA) Panel on Euthanasia."
Justification of the research	No animal should be used for experimentation for more than 3 years unless adequate justification is provided.	Research should be undertaken with a clear scientific purpose. There should be a reasonable expectation for research.	Research should be undertaken with a clear scientific purpose.	All animals found in a moribund state must be euthanized unless there is specific justification to do otherwise.	Research should be undertaken with a clear scientific purpose. There should be a reasonable expectation for research.
Sources of experimntal animals	Institution Biosafety committee and Institutional Animal Ethics Committee.	The USDA and local ordinances should be consulted for source of animal.	The only authentic source of getting right type of animals for research should be from recognized scientific animal facilities	A licensed or otherwise legally permitted source.	The USDA and local ordinances should be consulted for source of animal.
Care and housing of animals	Housing different species in separate rooms; however, cubicles, laminar-flow units, cages that have filtered air or separate ventilation, and isolators shall be suitable alternatives.	The facilities housing animals should meet or exceed current regulations and guidelines (USDA, 1990, 1991), and are required to be inspected twice a year (USDA, 1989).	It is important that they are housed in an isolated building located as far away from human habitations as possible and not exposed to dust, smoke, noise, wild rodents, insects and birds.	Animals should be housed in a manner that facilitates the expression of species-typical behaviour and minimises stress–induced behaviours.	The facilities housing animals should meet or exceed current regulations and guidelines (USDA, 1990, 1991), and are required to be inspected twice a year (USDA, 1989).
Legal provision	The Animal House should maintain records of chemicals, Breeding, stock, purchase, staff, sales records	-	Record should be kept for the breeding,stock, purchase, staff, sales records, death and animal use in experiment.	Record should be available to the personnel providing post-operative care.	-
Functionl areas	The size and nature of a facility will determine whether areas for separate service functions are possible or necessary.	Research conducted in populated areas should be done with respect for the property and privacy Of the inhabitants of the area.	-	The area should be according to the experimental protocol.	Research conducted in populated areas should be done with respect for the property and privacy Of the inhabitants of the area.

© 2017 Global Journals Inc. (US)

VII. Conclusion

The global trend for the use of animals in research is indispensible in several field hence the use of animal in research should be justify as the animal use in research maybe ethical in some way where alternative methods are not known or very expensive. The different methods which are alternatively used are sometimes beneficial sometimes not as seen in animal use too. Hence if experiment were performing on animal should be ethical as given in the guidelines for animal.

Constraints to Justice Against Rape Faced by Girls and Women: The Case of Wolaita Zone, SNNPR, Ethiopia

By Bereket Tessema Zewude, Kidus Meskele Ashine & Abebayehu Tora Kacho

Wolaita Sodo University

Abstract- An attempt has been made to see the victim of rape which indicates that one in every five women is victim of rape in her lifetime. The fear, psychological distress, and physical injury not only have a debilitating consequence on the victims of rape. But, the families and associates around them are exposed to various forms of social problems. However, rape and sexual assault against women remains a hidden crime for many of its victims. Even when reported to authorities, rape victims are still exposed to secondary victimization that results from the bureaucratic and institutional procedures. In addition, common myths and shared cultural definitions of 'real victims' and 'real rapes' have significant influences on public prosecutors and judges in the determination of real victims of rape.

Keywords: *attempted rape, completed rape, decision making, prosecution process, rape, wolaita zone, ethiopia.*

GJSFR-I Classification: *FOR Code: 390199*

Constraints to Justice Against Rape Faced by Girls and Women: The Case of Wolaita Zone, SNNPR, Ethiopia

Bereket Tessema Zewude [α], Kidus Meskele Ashine [σ] & Abebayehu Tora Kacho [ρ]

Abstract- An attempt has been made to see the victim of rape which indicates that one in every five women is victim of rape in her lifetime. The fear, psychological distress, and physical injury not only have a debilitating consequence on the victims of rape. But, the families and associates around them are exposed to various forms of social problems. However, rape and sexual assault against women remains a hidden crime for many of its victims. Even when reported to authorities, rape victims are still exposed to secondary victimization that results from the bureaucratic and institutional procedures. In addition, common myths and shared cultural definitions of 'real victims' and 'real rapes' have significant influences on public prosecutors and judges in the determination of real victims of rape. The objective of the study was to assess the prosecution process and rape case management and identify factors that influence the prosecution process in general and the decision making in particular in line with assessing the level of reported rape cases and identify factors that influence prosecution process by analyzing the filed documents in court for the last three years in study area. The result revealed that there is significant variation in the level of reported rape cases among the selected woredas. The age of the victims and suspects ranges from 2.5 to 50 years and 7 to 60 years, respectively while the mean age is 16.9 years for the victims and 23.5 years for the suspects. Over 50% of the rape victims were within 9-17 years of age while 69% of the suspects were within 18-35 years. Interestingly, married couples constitute the significant number in terms of both reporting and victimization that is 18.4% for the victims and 29.7% for the suspects. Compared to attempted rape, completed rape is the dominantly reported type of rape. For only 5.1% of the victims, police and public prosecutors could collect exhibits of which 2.2% were knives. Majority of reported rape cases have been rejected either before or after the public prosecutor instituted the case considering that the evidences were insufficient to be admissible which accounted 32.9%. Only on 19.3% of the reported rape cases the judges reached to the decision that the suspect is guilty and must be sentenced. On the other hand, over 45% of the cases have been interrupted either before or after the public prosecutor instituted the case. Those victims who report attempted rape have also higher chance of being rejected compared to those who report completed rape ($\boldsymbol{OR = 3.168, 95\%\, CI = 1.45, 6.92}$). The average years of imprisonment for the suspects proved guilty is 8.7 while the minimum and maximum are 3 months and 20 years, respectively. There is also a moderate inverse correlation between victim's age and penalty determination among judges observing correlation coefficient $\boldsymbol{r = -0.423, p = 0.001}$.

Keywords: attempted rape, completed rape, decision making, prosecution process, rape, wolaita zone, ethiopia.

I. Introduction

Crime statistics available from many countries would indicate that most victims of rape or sexual violence make the choice not to report the crime to the authorities and as a consequence '. . . rape remains a hidden crime for many of its victims' (Edwards, 1996, 332). Estrich further states that rape is distinguished from other crimes not so much because of the 'disproportionate numbers of actual complaints but because of the disproportionate numbers of cases that are never reported' (Estrich, 1987: 54). Studies have shown that victims may be reluctant to report sexual violence for a variety of reasons (Temkin, 1987)11; Adler, 1987:4; Katz and Mazur, 1979:186). Interviews with victims have consistently revealed that the reasons for not reporting include: (i) fear of how they will be treated by people within the criminal justice system, (ii) not wanting what happened to them to become public, (iii) fear of lack of evidence (U.S. Dept. of Justice, 1994). Moreover, societal presumptions and myths about rape may foster feelings of guilt and self-blame which inhibit victims from reporting. McColgan (1996) concludes that many women do not define their experience as rape, particularly if they know their attacker.

Involvement in the legal process usually results in secondary distress to the victims too often endure insensitive treatment at the hands of the criminal justice system, or what has come to be referred to as 'secondary victimization'. Holmstrom and Burgess (1978), in their now classic study of how legal and medical institutions react to the victims of rape, emphasize that the very institutions which exist in part to aid and protect in reality often further victimize victims. These authors point out that ' . . . Rape does not end with the departure of the assailant. Instead, the institutional processing that occurs can be equally

devastating for the victim' (Holmstrom and Burgess, 1978, p.vii).

Regarding the extralegal factors influence the prosecution process of rape common myths and shared cultural definitions of 'real' rapes and 'real' victims also combine to enhance victims' fear of being disbelieved (Stewart et al, 1996). The extra-legal factors are also taken into account both by the police and by prosecutors in deciding whether to pursue a case or not. Prior consent to sexual intercourse with the accused; 'risky behavior' such as getting into a car with a man met at a bar, kissing at a bar, having too much to drink, or inviting a man into the house to have a drink; all are signs of 'misconduct' which implicated the woman (Stewart et al., 1996).

When we come to situation of rape and sexual assault in Ethiopia showed that 6.2% of the students who have started sexual intercourse, 26.1% were raped cases and 75.9% of the students reported being sexually harassed in study area, Addis Ababa (Lelisa& Yusuf, 2008). Also, the prevalence of gender based violence in general and sexual violence in particular. A study among high school students revealed that girls are even denied their freedom of movement and are afraid of moving or walking alone in broad day light even in the streets of big cities like Addis Ababa and school based cross sectional survey conducted in Debark, north western Ethiopia indicated the prevalence of completed and attempted rape to be 8.8% and 11.5% respectively (Worku et al., 2002). Also the study conducted in Addis Ababa University among 612 female students, the prevalence of lifetime completed and attempted rape was 12.7 % and 27.5% respectively while sexual harassment in lifetime and 12 month period accounted 58% and 41.8% respectively (Tadesse, 2004). A study conducted in Hawassa University recorded the overall prevalence of gender based violence among 1330 female students and found 59.9% lifetime, 46.1% since enrolling college and 40.3% current academic year (Dodie et al., 2008).

II. Methodology

a) Description of study area

The study was carried out in Wolaita Zone, Ethiopia year of 2013. Wolaita Zone consists of 13 woredas found in temperate region of South Nationalities and Peoples (SNNP) regional state with capital town of Sodo. Sodo town is located (54^0N latitude and 380^0 S longitude) and 396km south of Addis Ababa and 130km from regional town Hawassa.

b) Study Design

The research design was qualitative as well as quantitative research design can be employed.

c) Source of Population

The source of population consists of 12 woredas and 3 admistrative towns in wolaita zone for study purpose.

d) Sampling Technique

Among 12 Woredas and 3 administrative towns we take a sample of 6 woredas and 1 administrative towns using purposive sampling technique.

e) Variables Identification

For study purpose our dependent variables includes: Rape victims and suspects, condition of reported rape cases and decision making process.

f) Independent Variables

Socio-demographic variables

g) Data Collection

Both primary and secondary data collection method were applied to get the desired information. Primary data were collected through a questionnaire. The questionnaire was prepared, pre tested and administered for the selected woredas and administrative towns. Secondary data collected by using document analysis in selected woredas and administrative towns. Two separate cross sectional studies have been conducted through document analysis on prosecution process.

h) Data Entry and Analysis

Data entry and cleaning were carried out using statistical soft ware package SPSS version 22.0 for the analysis. The analysis employed here is that descriptive statistics analysis was used to show the frequency distribution and its results were presented by tables. Also binary logistic regression model (odd ratio) was used.

III. Results and Discussion

Table 1: Condition of reported rape cases

Variables	Category	Frequency	Percent
Type of Rape	Attempted	131	41.5
	Completed	185	58.5
	Total	316	100
Time of report	Reported more than 24 hours later	188	59.5
	Reported within 24 hours	88	27.8
	Total	276	87.3

© 2017 Global Journals Inc. (US)

Place where rape committed	Suspect house	34	10.8
	Victim house	44	13.9
	Jungle	35	11.1
	Hotel room	9	2.8
	On the way to or from home	13	4.1
	Around the river	10	3.2
	At school	4	1.3
	Farm place	3	.9
	Work place	1	.3
	Church compound	1	.3
	Not stated in the document	162	51.3
	Total	316	100.0
Reported means used to attempt or commit rape	Through oral intimidation	32	10.1
	Through intimidation using weapon	70	22.2
	Through using Physical force	191	60.4
	Through fraud or cheating	18	5.7
	Total	311	98.4

Based on table 1, compared to attempted rape, completed rape is the dominantly reported type of rape. However, about 60% of reported rape cases were reported more than 24 hours after the incident. Interestingly, for 51.3% of the reported rape cases, the police or the public prosecutors did not trace where exactly the suspects attempted or committed rape. For those cases scene of rape indicated, majority of rape have been attempted or committed at victims' and suspects' house respectively. Victims also indicated those means used by the suspects during the incident. The use of physical force and intimidation using weapon accounted 60.4% and 22.2% respectively.

Table 2: Decision making and prosecution process

Variables	Category	Frequency	Percent
Decision	Case rejected	107	33.9
	Suspect proved guilty and sentenced	61	19.3
	Total	168	532
Stage at which case has been rejected	Case rejected by public prosecutor	65	20.6
	Case rejected by judges in the court	42	13.3
	Total	107	339
Reason for decision	Due to lack of sufficient evidence	104	32.9
	Evidence persuaded beyond reasonable doubt	61	19.3
	The suspect was too young to qualify for prosecution	1	.3
	For unknown reason	2	.6
	Total	168	532
Interruption	Interrupted before the public prosecutor institutionalized prosecution	109	34.5
	Interrupted while the case was being taken care of in the court	34	10.8
	Total	143	45.3
Reason of interruption	Disappearance of suspect	59	18.7
	Lack of follow up by the victim	22	7
	The suspect was too young to qualify for prosecution	3	0.9
	Due to arbitration by two families	29	9.2
	Witnesses were blocked or disappeared	23	7.2
	Total	136	43.
Number of days elapsed after involvement in the prosecution process	30 and below	95	30.1
	31-90	92	29.1
	91-180	48	15.2
	181 and above	22	7.0
	Total	257	81.3

© 2017 Global Journals Inc. (US)

From table 2 the result shows that among 316 reported rape cases, 168 (53.2%) were identified in the documents with decision passed either by public prosecutor or judges in the court as rejected or proved guilty. Majority of reported rape cases have been rejected either before or after the public prosecutor instituted the case considering that the evidences were insufficient to be admissible which accounted 32.9%. Most of the rejections were made by public prosecutors before prosecution was instituted. Only on 19.3% of the reported rape cases the judges reached to the decision that the suspect is guilty and must be sentenced. On the other hand, over 45% of the cases have been interrupted either before or after the public prosecutor instituted the case. Interestingly, most interruptions of the prosecution process were attributed to disappearance of the suspect after the incident or in the trial process. Other cases were interrupted due to reasons related to arbitration, disappearance of witnesses and luck of follow up by the victims constituting 9.2%, 7.2% and 7% respectively. After involvement in the prosecution process, the average amount of time the complaints must wait is 83.3 days. But, the number of days elapsed after involvement in the prosecution process ranges from 1 to 1820. The interesting side of timing is that majority, i.e. 30.1% of the reported rape cases remain active in the prosecution process for less than 30 days. Over 29% of the cases lasted about 31-90 days (that is 1-3 months) while 15.2% of them stayed in the prosecution process for about 91-180 days. Only 7% of the reported rape cases lasted for more than 6 months.

IV. Binary Logistic Regression Analysis

Table 3: Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	494.061[a]	.29	.36

From the above table Nagelkerke R^2 in model summary table above is 0.36, which indicates that 36.0% of the variability in rape was explained the explanatory variables.

Table 4: Goodness of fit (Model Diagnostic)

Hosmer and Lemeshow Test

Step	Chi-square	df	Sig.
1	13.732	7	.075

As it is observed from the table above since P-value is 0.075 is greater than the level of significance at 5%. We can conclude that the data fits the model well. Since the p-value is 0.075 which is insignificant therefore our fitted logistic regression model is good fit (Table 4).

Table 5: Binary Logistic Result

		B	S.E.	Wald	df	Sig.	Exp(B)=0dds ratio	95% CI
Step 1[a]	Attempted rape Completed rape (ref.)	1.153	.218	5.289	1	*.042*	3.168	(1.45, 6.92)

From table 5 those victims who report attempted rape have also higher chance of being rejected compared to those who report completed rape ($OR = 3.168, 95\%\ CI = 1.45, 6.92$).

Also there result of correlation coefficient indicate that there is also a moderate inverse correlation between victim's age and penalty determination among judges observing correlation coefficient $r = -0.423, p = 0.001$.

V. Conclusions

- From binary logistic regression analysis the result of the study concluded that attempted rape has also higher chance of being rejected compared to those who report completed rape.
- From correlation analysis there is moderate inverse correlation between victim's age and penalty determination among judges.
- Based on descriptive statistics analysis compared to attempted rape, completed rape is the dominantly reported type of rape.
- Majority of reported rape cases have been rejected either before or after the public prosecutor instituted the case considering that the evidences were insufficient to be admissible.
- More cases have been interrupted either before or after the public prosecutor instituted the case.

Parabolic Dish Concentrating Collector for Indirect Solar Cooking

By Amós Veremachi, Azher Zia, Boaventura C. Cuamba, Jorgen Lovseth & Ole Jorgen Nydal

Dhing College, Dhing, Nagaon, Assam

Abstract- Thermal performance of a point focus solar concentrating collector comprising a 2000 mm diameter, and a 665 mm focal length symmetric parabolic dish concentrator covered with reflective aluminum tiles of 0.9 reflectivity and SiC honeycomb volumetric absorber, which use atmospheric air as heat transfer fluid is experimentally investigated. The absorber was tested for two different mass flow rates. The test was intended to assess the potential of this collector as a component of solar cooker with heat storage, a prototype that has a potential to enable indirect and off-sun cooking. The prototype of a solar cooker under investigation is intended to be used in rural areas (in Mozambique) to meet multiple domestic needs in thermal energy as part of a global effort to mitigate the consequences of one of the severe problems the world faces today (desertification and deforestation), some of which are attributed to climate change.

Keywords: *energy; parabolic dish; renewable sources; thermal performance; solar cooker.*

The absorber was tested for two different mass flow rates. The test was intended to assess the potential of this collector as a component of solar cooker with heat storage, a prototype that has a potential to enable indirect and off-sun cooking. The prototype of a solar cooker under investigation is intended to be used in rural areas (in Mozambique) to meet multiple domestic needs in thermal energy as part of a global effort to mitigate the consequences of one of the severe problems the world faces today (desertification and deforestation), some of which are attributed to climate change. Thermal efficiency of the collector was estimated for the two mass flow rates. Preliminary results have shown that at the target temperature range the collector efficiency remained above 70 % and that the higher the mass flow rate, the lower the temperature of the air coming out of the collector.

Keywords: energy; parabolic dish; renewable sources; thermal performance; solar cooker.

I. Introduction

External energy sources are an important factor for human life and development. Sufficient access to quality energy is one of the indicators of human development.

Mozambique is ranked among the countries with lowest access to electricity per capita, with only 25 % of its population connected to national electricity grid [1]. Like many other African countries, it has the majority of its population living dispersed in rural areas and depending mainly on biomass as a source of thermal energy for their multiple domestic needs. The biomass share on the country's primary energy is more than 78% [2].

Author ¥: Professor, Department of Energy and Process Engineering, NTNU-Trondheim-Norway. e-mail: ole.j.nydal@ntnu.no

Currently, however, the sources of biomass are becoming scarcer due to deforestation, changes in land use, desertification [3]-[4]. The deforestation rate in Mozambique is more than 5.6 % [5]. This reality put at risk the future of many women and children whose burden is increased due to the fact that at the present more time is required on fetching firewood to meet the families daily energy needs for cooking.

Luckily, Mozambique is among the countries with a considerable potential of renewable sources of energy. In particular, owing to the country's geographical location, the solar radiation intensity is good; with a daily annual average of $5.2\ kWh/m^2$ [2]-[3]-[6]. Therefore, direct collection of solar thermal energy can be an energy source for multiple domestic needs (cooking, frying, hot water, pasteurization, etc) in rural areas of Mozambique. Adoption of solar energy as a source of thermal energy also holds other indirect benefits such as an increased time availability for women and children to dedicate to their educational activities; improved in-door environment and natural environment, and less risk of burning accidents [29].

Cooking is energy intensive activity requiring medium-to-high temperatures, and thus demanding appropriate technology for harnessing and using it in an efficient way. This requirement and the low density of solar radiation at the Earth's surface turn the harvesting of this resource for cooking applications a difficult task. In direct sun, however this is possible using solar concentrators.

Over a global growing concern, on the future of conventional energy resources, solar concentrating collectors became one of the major focuses of research endeavors mainly for large scale Concentrating Solar Power applications, for more details see [7]-[8].

Currently, however there is also a growing concern over energy scarcity in small scale applications as the world witnesses the depletion of the major energy sources for people living in rural areas in developing countries. Thus, in some groups of interest small scale prototypes became a major focus of research aiming to assess their potential to benefit people in rural areas of developing countries, as a source of thermal energy for multiple domestic purposes.

Solar cooking has witnessed improvements in both research and design and deployment. In fact, solar cookers of different configurations have been suggested and some have been applied. However, the more

© 2017 Global Journals Inc. (US)

widespread solar cooker types allow for direct cooking; in which case collection and cooking are performed simultaneously, for more details see [9]. Normally the cooking pot is placed onto focal point of the concentrator and the person performing cooking is subject to perform it under sun; facing all the potential consequences arising from excessive exposition to solar radiation.

Direct solar cookers can, however, only be used during periods of direct sun shine. Therefore, they have limited usefulness when the sun shine is intermittent due to weather conditions and cannot be used in off-sun conditions.

The intermittency of the sun shine, the risks associated with the reflected radiation and the lack of cultural acceptance, are some of the factors that have limited the use of solar cookers in Mozambique, as discussed by Otte [10].

To overcome some of the limitations of direct solar cookers, a thermal storage is essential in the solar system. Solar heat can then be collected while the sun is available and stored for later use. So, a solar stove with heat storage, which has a potential to enable indirect and off-sun cooking has be proposed.

The proposed system comprises a collector subsystem (parabolic dish solar concentrator-PDSC and absorber), heat storage (HS) and the tracking mechanism.

The collection of solar thermal energy can be done through different configurations. In one of them, the absorber can be a component part of the HS, as it was done by [11]-[12]; in which case the charging is done by direct illumination of the storage [29]. Thus the heat is absorbed at the top part of the HS and conducted through the storage medium; in the other configuration, the absorber and HS are different entities, for details see [13]-[14]-[15]. In the latter case, a heat carrier medium is required to transport the generated heat in both charging and discharging mode.

In many applications, PDSC appears coupled with Stirling engine for electricity production purposes [16]-[17], and some studies on application of PDSC that have thermal energy as an end product for cooking purposes used oil as heat transfer fluid [18]-[19]. Meanwhile common applications of solar collectors using air as HTF are intended for space heating and crop drying [20]. Scarcely are found examples of successful applications of PDSC that use air as heat transfer fluid that are intended for collection of solar thermal energy for cooking purposes.

The performances of the components are interdependent in some way and together they determine the performance of the prototype. However, the performance of the collector subsystem is crucial and can affect the performance of the enter system. If the collector has poor performance, then the storage component becomes meaningless.

To assess the potential of PDSC collector to be used as a component of a solar cooker intended to enable indirect cooking; in this paper its thermal performance is experimentally investigated. The PDSC is coupled with Siliconized Carbide (SiC) honeycomb as absorbing material and air as heat transfer fluid (HTF). The collected heat is stored as sensible heat in a rock-bed HS. The rock-bed is a two phase system comprising a solid material and HTF. During charging mode the HTF enters the storage at high temperature and as it goes through the voids gives up heat to the rocks and emerges at the exit at low temperature. As a consequence the bed temperature rises. To enable the purpose of this paper, outdoor tests were performed at Norwegian University of Science and Technology-Department of Energy and Process Engineering (NTNU-DEPE). The present paper will not include thermal analysis on the storage.

Nomenclature:

A_{ap}	[m^2]	Concentrator aperture area
A_{abs}	[m^2]	Absorber area
C	[..]	Geometric Concentration ratio
I_b	[W/m^2] [..]	Beam radiation Intensity
η_o	[..]	Optical Efficiency
η_{th}		Thermal Efficiency

II. Background Information and Governing Equations

Concentrating solar collectors are optical devices that concentrate low density solar radiation falling on their reflective surface onto a small area (absorber), thus turning the low energy density into high energy density. At the absorber surface, solar radiation is converted into thermal power and, due to high flux of solar radiation falling on it, high temperatures are produced and this effect can be used for different purposes including cooking.

Receivers are an integral part of any solar collector. In the context of PDSC applications, cavity receivers and volumetric receivers are the two types of receivers commonly used [21].

Witness of the relative importance of solar receivers, is the endeavor among researchers that have been focused on receiver modeling, not to name all, see for example [4]- [22] or through experiment [13]- [23]- [24].

Receivers for concentrating collectors should be designed in such a way to intercept as much reflected radiation from the concentrator as possible while at the same time ensuring that radiative heat losses from the receiver are minimized. Therefore, their size is determined by the compromise between intercepted radiation maximization, and heat loss from the receiver minimization to enable maximum power at sufficient temperatures for the intended application [22]. For high temperature applications, solar absorbers should have high temperature stability [16].

Consonant to these requirements, [23] performed experimental investigation of heat losses from a small cavity receiver, using simulated solar heat source and a Synthetic Schlieren technique for flow pattern visualization out of the cavity. In addition to this, numerical modeling of convective heat losses from the receiver through CFD analysis was carried out for positive angles.

In their turn [18] designed, fabricated, studied and compared the performance of three different receivers (Volumetric Flash-VF, Volumetric Box-VB and conical tube-CT) using a PDSC designed to charge the HS. The receivers were designed to use oil as HTF. One of their findings suggested that the CT was appropriate for the concentrator due to its high thermal efficiency compared to the others, for a given flow rate.

Using air as HTF, [13] investigated the thermal performance of two similar flat solar absorbers made of different materials (stainless steel fiber wire mesh and SiC honeycomb) in a small scale PDSC. Their findings point out that HTF temperature and flow rates correlate negatively, while efficiency and flow rates correlate positively. In either case, the stainless steel absorber had a good performance as compared to honeycomb absorber.

Another study on the thermal performance of a point-focus PDSC was done by [25]. A cylindrical receiver intended for hot water or steam generation applications was used. The purpose was to find the optimal operating temperature and the impact of environmental conditions on heat loss mechanisms of the external receiver under windy conditions and in different facing directions of the blackened absorber. Their findings confirmed the well-known strong effects of absorber wall temperature, wind velocity and direction and ambient air temperature on total heat loss from the absorber.

The attainment of high temperatures in solar concentrating collectors is directly connected to the concentration ration of the collector. This notion relates the aperture area of a solar collector with the area of its absorber. Concentrator aperture area A_{ap} is the area of the collector that intercepts solar radiation. The

© 2017 Global Journals Inc. (US)

concentration ratio C is the ratio between aperture area of the concentrator and the absorber area, A_{abs} :

$$C = \frac{A_{ap}}{A_{abs}} \quad (1)$$

Not all the solar radiation incident onto the concentrator surface is intercepted and captured by the absorber. The optical efficiency η_o is the ratio of the energy absorbed by the absorber to the energy incident on the concentrator surface.

$$\eta_o = \frac{\dot{Q}_{abs}}{A_{ap}.I_b} \quad (2)$$

The ratio between the power incident at the absorber surface and the power received by the concentrator is a function of many factors (e.g. the ability of the tracking mechanism to keep the optical device accurately aligned with the sun, optical properties of the reflective surface and the nature (perfect or imperfect) of the concentrator geometry.

Again, not all the energy absorbed at the absorber surface is converted into useful energy. The high energy density at the absorber surface gives a high temperature. Therefore, temperature gradients between absorber and ambient arise and become a driving force for heat losses; the absorber becomes hotter than the surrounding components and ambient. As such, heat losses may occur in different modes (conductive, convective and radiative). The ability of the absorber to minimize heat losses is connected to thermal efficiency of the absorber. Thermal efficiency of the absorber is given by the following expression:

$$n_{abs} = \frac{\dot{Q}_u}{\dot{Q}_{abs}} \quad (3)$$

This parameter accounts for all types of thermal losses from the surface where heat is generated.

From formula (3), an alternative expression for useful heat can be obtained as follow:

$$\dot{Q}_u = \eta_{abs}\dot{Q}_{abs} = \eta_o\eta_{abs}A_{ap}I_b = \eta_{th}A_{ap}I_b \quad (4)$$

In the expression above $\eta_{th} = \eta_o\eta_{abs}$ is the overall efficiency of the collector for the optical to thermal conversion.

Energy balance equation formulated at the absorber can be written as:

$$\dot{Q}_{abs} = \dot{Q}_u + \dot{Q}_l \quad (5)$$

Where

$$\dot{Q}_u = (\dot{m}.c_P)_f.(T_{out} - T_{in}) \quad (6)$$

$$\dot{Q}_l = A_{abs}.U_l.(T_{av} - T_a) \quad (7)$$

In the above equation U_l is the overall heat loss coefficient. Solving for $\dot{Q}_u$, the following expression is strait forward:

$$\dot{Q}_u = \dot{Q}_{abs} - \dot{Q}_l = \eta_o A_{ap} I_b - A_{abs}U_l(T_{av} - T_a) \quad (8)$$

To characterize the thermal performance of a solar concentrating collector, the concept of thermal efficiency is used. This concept refers to the ratio between useful energy carried by the HTF and the energy falling onto concentrator aperture:

$$\eta_{th} = \frac{\dot{Q}_u}{A_{ap}I_{ap}} = \frac{(\dot{m}c_P)_f(T_{out} - T_{in})}{A_{ap}I_{ap}} = \eta_o - \frac{A_{abs}U_l}{A_{ap}I_{ap}}(T_{av} - T_a)$$

$$\eta_{th} = \eta_o - \frac{U_l}{\frac{A_{ap}}{A_{abs}}I_b}(T_{av} - T_a) = \eta_o - \frac{U_l}{CI_b}(T_{av} - T_a) \quad (9)$$

Assuming all radiation reflected from the concentrator surface reach the absorber surface:

$$\dot{Q}_l = \eta_o A_{ap} I_b - \dot{Q}_u \Leftrightarrow A_{abs}U_l(T_{av} - T_a) = \eta_o A_{ap} I_b - \dot{Q}_u$$

The energy balance enables the computation of U_l as a function of the absorber temperature:

$$U_l = \frac{\eta_o A_{ap} I_b - \dot{Q}_u}{A_{abs}(T_{av} - T_a)} = \frac{\dot{Q}_l}{A_{abs}(T_{av} - T_a)} \quad (10)$$

III. Research Methodology

For the test to take place, a SiC honeycomb absorber 105 x105x105 mm^3 from the Chinese Company Pingxiang Zhongying Packing Co. LTD was delivered at DEPE-NTNU.

A cubic receiver housing with truncated cone terminal was prepared in Department's Lab and the Sic was inserted within the housing, see Fig.1 .In [8], advantages of SiC honeycomb absorber that favor its application in solar industry are outlined; not to name all, high temperature tolerance, thermal shock resistant and also mechanical strength are some of them.

The receiver was then mounted onto parabolic dish concentrator through a support structure that enabled it to have the lower surface to be located at the focal region of the concentrator, see Fig.2.

Then the receiver was connected to an air carrying pipe comprising stiff pipe which in turn was connected to the flexible pipe (made of 3 pieces of corrugated steel flexible pipe connected one after the other). The pipe was intended to carry the heated air from the receiver to the storage.

© 2017 Global Journals Inc. (US)

To monitor temperatures at the irradiated surface of the absorber and also temperature of the air leaving the absorber, 3 to 4 thermocouples were used. One at the absorber surface, 3 at different positions along the air carrying pipe of which the first was positioned 5 cm above the upper surface of the absorber.

a b c

Figure 1: Showing a) SiC honeycomb absorber, b) Absorber housing and c) The receiver

Then, the absorber housing was covered with one layer of 5 mm Aerogel insulation, followed by a cover of two layers of reflective aluminum film on top. The geometric concentration ratio of the collector is 272.

Table 1: Sic honeycomb properties

Property	Values	Property	Values
Nr channels	17x14	Side wall thickness	1.3 mm
Channel dimension	7.5 mm	Specific surface area	366 m^2/m^3
Wall thickness	1.2 mm	Void (%)	57 %
Specific heat	750 J/kg.k	Thermal Conductivity	50-250 W/m.k

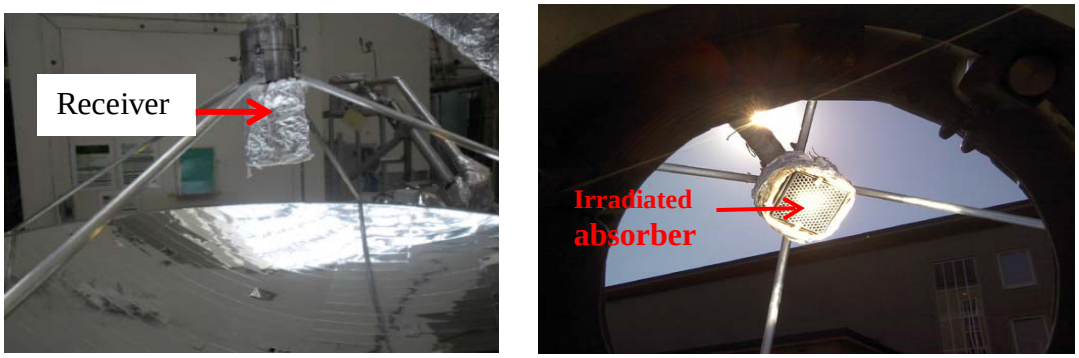

Figure 2: Shows receiver mounted on the setup (left) and irradiated receiver during tests (right)

The forced convection is generated by a fan with speed controller-P.Lemmens from air movement Company Type ESB3 Rev04-010009 connected to the HS outlet. The air speed is measured at fan outlet which has the same diameter as the air carrying pipe. Assuming no air leakage along the pipe and in steady state the air speed at the fan outlet can be used to calculate the air speed along the carrying pipe.

The average air mass flow rate is estimated through the expression (11):

$$\dot{m} = Av_{av}\rho_{av}(T) \qquad (11)$$

In this expression A is the cross sectional area of the pipe, v_{av}, the average air speed (air speeds were measured each 30 min, using a handheld W_M Digital Anemometer DA 4000 and from the data the average was calculated); $\rho_{av}(T)$ the average air density as a function of temperature (taken from tables of thermophysical properties of air).

The mentioned set of thermocouples was then connected to a data logger which in turn is interfaced to a PC through a labview program to log temperatures each second.

The incident beam flux was measured using a pyrheliometer at meteorological station located at the roof of Physics Department building located at the same Campus as the test location.

The following figure shows the setup used during the experiment.

© 2017 Global Journals Inc. (US)

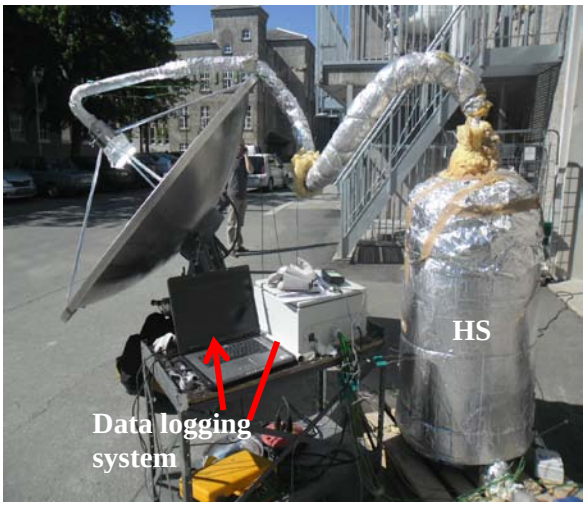

Figure 3 a: Showing the heat storage and data logging system

Figure 3 b: Showing the collector sustem during the test

In the first experiment, run under an average air mass flow rate of 4.4 g/s, only 3 thermocouples were used to monitor temperature of air along the pipe. The thermocouple located at the surface of the absorber had a cupper support to help fix it at the central honeycomb absorber channel. However, due to high flux density the metal was melt and the sensor did not give the readings. So, T_1 is the first thermocouple measuring the temperature of air leaving the collector.

In the second test however, run under an average air mass flow rate of 5.52 g/s, another thermocouple was positioned at the absorber surface. Therefore, T_1 represents reading from that thermocouple, while T_2 is the temperature of air leaving the collector given by the first of 3 thermocouples along the air carrying pipe.

The pressure drop is an important parameter for the collector performance as it is a source for an informed choice of pumping power. With Reynolds number estimated at 725.5, through the small channels of the absorber the flow regime is laminar and the pressure drop can be calculated as in [26] by :

$$\Delta p = \frac{32\mu v \Delta x}{D^2} \tag{12}$$

The power required can be calculated as follow:

$$P = \frac{\dot{m}\Delta p}{\rho(T)} \tag{13}$$

IV. Results and Discussion

Figure 4 shows temperature of air leaving the collector at different points along the pipe and beam intensity at the first test.

As can be seen from fig.4, the air leaves the collector at temperatures above 350°C during the experiment; with even high temperature between 10:19 and 11:34 probably due to high beam radiation intensity registered during this period. The sharp drops in air temperature encounter justification on weather conditions, shading of sun by clouds. This factor can be witnessed by the curve of beam radiation. Other factors are radiation loss due to imperfect focusing and increased convective heat losses.

In most of the cases, the drop in air temperature is not simultaneous with drop in beam radiation intensity. Due to thermal inertia, when beam radiation drops due to passing clouds, the absorber is still hot and hot air is pumped in; only after some time it also drops.

© 2017 Global Journals Inc. (US)

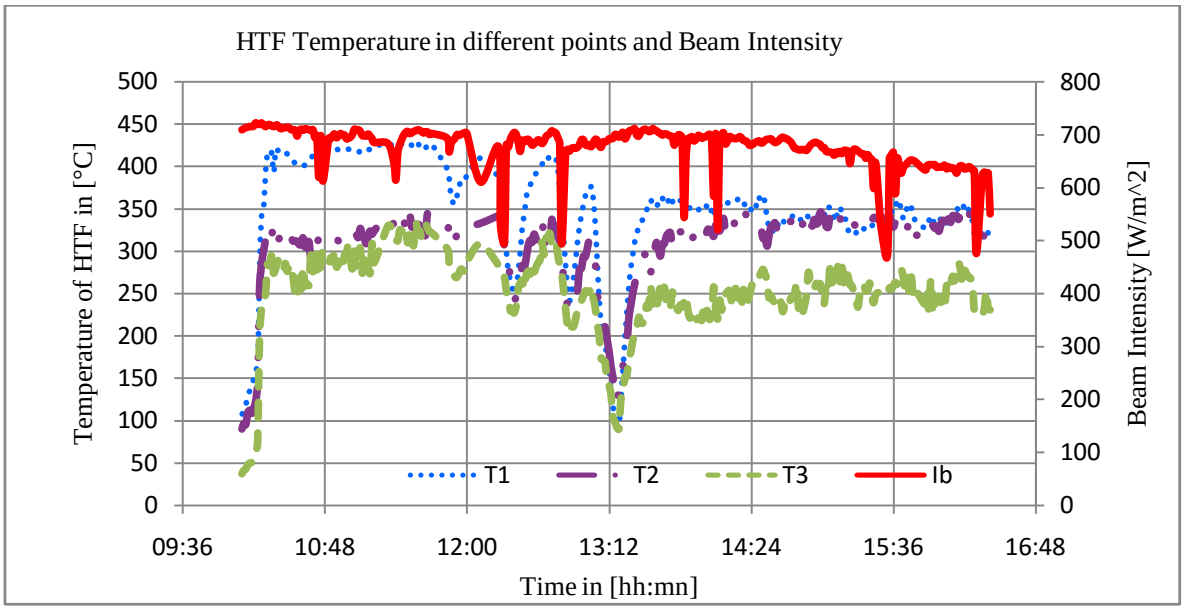

Figure 4: Showing Beam Intensity and temperature profiles of the air leaving the colector in 3 different points along the pipe during 1st experiment (9/7/2014)

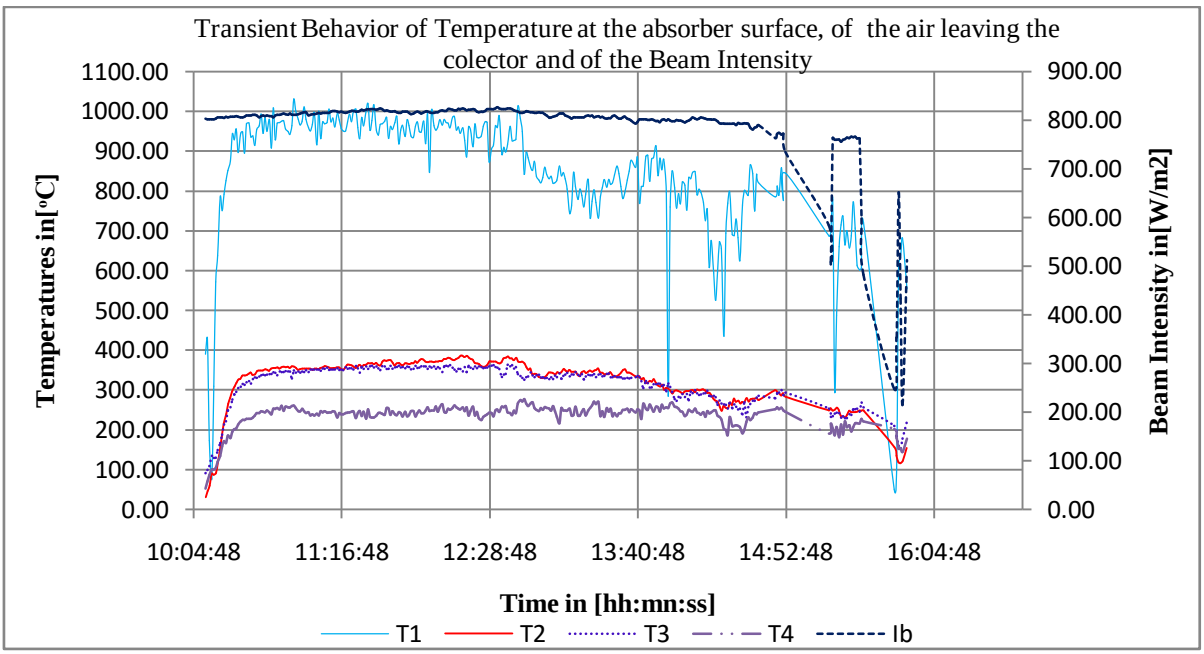

Figure 5: Showing beam radiation intensity, temperature profile at the absorber surface and of the air leaving the collector at 3 different points along the pipe during 11.07.2014 test

In figure.5, the behavior of beam radiation intensity I_b, the temperature at the absorber surface T_1 and the temperature of the air along the air carrying pipe (T_2 to T_4) during second test are compared. The experiment was run under an average air mass flow rate of 5.52 g/s. This mass flow rate is almost 25% higher than the mass flow rate in the first experiment. This increase is mainly due to an increased sucking speed. The immediate consequence of an increased fan speed is less time interaction between the HTF and the absorbing material.

As can be seen from the I_b curve, during the second test, beam intensity remained almost steadily during the major part of the test (from 10:11 hrs to 14:40 hrs), but the temperature at the surface of the absorber surface varied appreciably. These variations can be attributed to radiation loss due to imperfect focusing and convective heat losses. Despite these factors, it can be noted from the readings of the first sensor for air temperature, T_2 that during this period the HTF left the collector at the temperatures above 350°C most of the time.

© 2017 Global Journals Inc. (US)

Figure 6 shows the behaviors of the beam radiations during the first and second tests. From this chart it can clearly be seen that the weather during the 2nd experiment was good during most of the time as compared to the 1st test. Hence, the beam radiation for the 2nd test remained stable and slightly higher than during the 1st test. However, a comparison between Fig.4 and Fig.5, reveal the effect of an increased air mass flow rate on the temperature of the air leaving the collector. This can be easily seen by the fact that although beam radiation intensity was slightly lower in the first experiment as compared to the same quantity in the second experiment, the temperature of the air leaving the collector is lower in the second experiment.

Although there was a drop on the air temperature leaving the collector during the 2nd test, caused by an increased mass flow rate, in both cases the HTF leaves the collector subsystem at temperatures above 350°C, suitable for cooking and frying purposes.

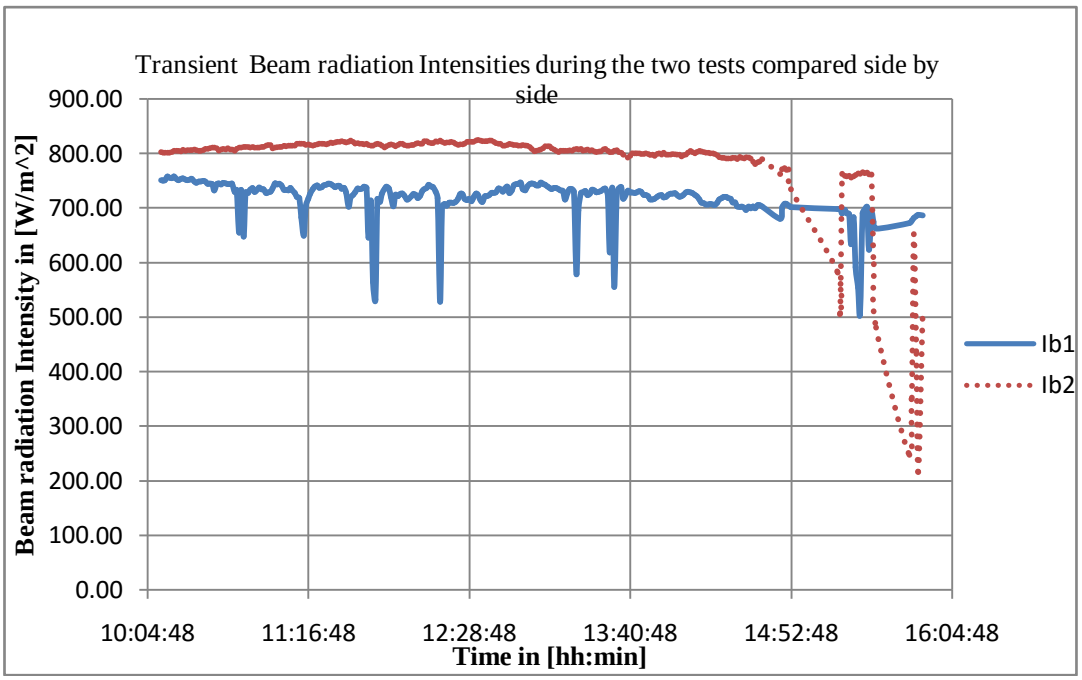

Figure 6: Charts showing the behavior of beam radiation during the 1st (09/07/2014) and 2nd (11/07/2014) tests

In figure 7, the behaviors of solar power input, the useful heat, radiative heat losses and the absorber temperature during the 2nd test are compared.

As can be seen from fig.7 the curve showing the behavior of radiative heat losses throughout the test is similar to the curve of the absorber temperature during the same period, as expected. The higher the absorber surface temperature, the higher the radiative heat losses become.

High temperatures were observed at the absorber surface during the test. From Stephan-Boltzmann law, radiative heat losses become pronounced at temperatures of order of 10^2 degrees. In our case, despite the small absorber area, radiative heat losses are expected to be dominant over other forms of heat losses owing to high temperatures at its surface, as indicated by the curve given by T_1 in figure 5.

© 2017 Global Journals Inc. (US)

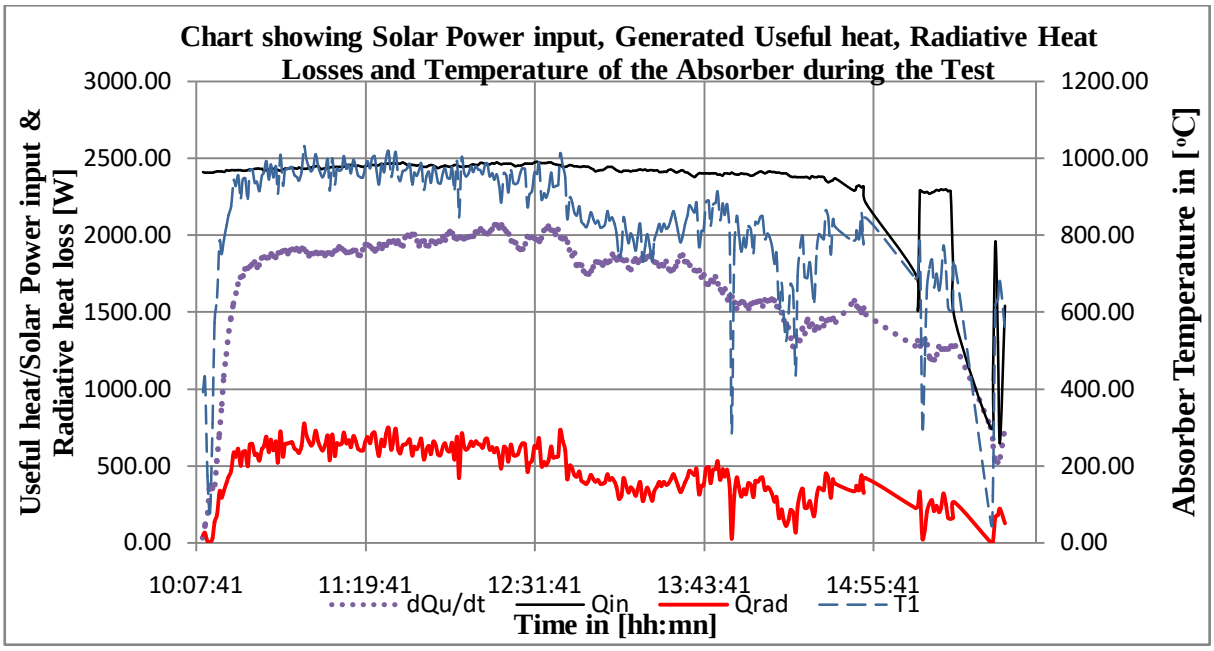

Figure 7: Showing Solar Power input, Useful heat, radiative heat losses and Absorber temperature during the test

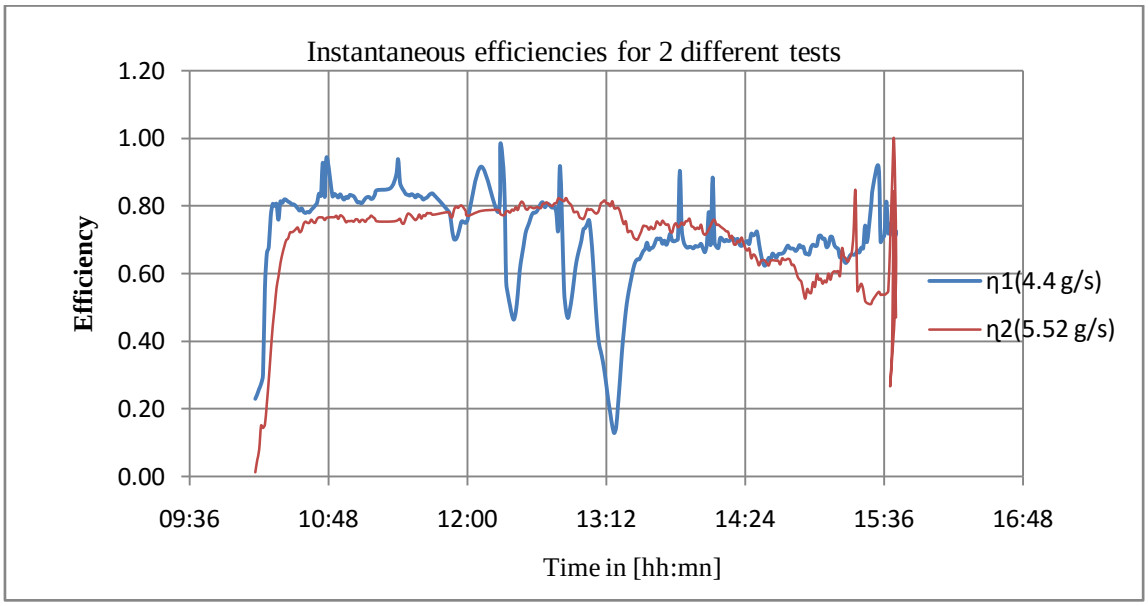

Figure 8: Showing transient instantaneous efficiencies for both tests

In figure 8 the transient behavior of instantaneous efficiencies for two experiments, performed under different mass flow rates, are presented. As can be seen from the chart, the instantaneous curve for the first experiment exhibit sharp increases and sharp drops on the efficiency, while for the second test is stable between 10:15 hrs until 13:00 hrs. The behavior of the instantaneous efficiency reflects the behavior of beam intensity during the experiments, respectively. Sharp increases reflect the consequence of source obstruction by clouds and the phenomenon of thermal inertia of the absorber, as explained before. But sharp drops may reflect loss of radiation due to imperfect focusing as well as an increased wind speed. Both factors lead to a decrease on useful heat carried by the HTF.

The solar heat is absorbed on the receiver surface, pass into the material by conduction and is then transferred to the air flow. Thus, the temperature of the surface is considerably higher than the air exit temperature, dependent on the conductivity of the absorber material and the heat transfer process. A simplified model for heat transfer will be discussed. As the radiation distribution on the receiver was not monitored, constant radiation intensity on the top was assumed. The flow through the receiver is laminar by a clear margin. This means that the heat transfer coefficient h is independent of channel air speed and

© 2017 Global Journals Inc. (US)

that the pressure drop is given by equation 10. The width between parallel hexagonal channel sides is 5.5 mm and Δx is length. Since μ varies approximately as $T^{2/3}$ in the actual region, v will be depressed in the hot, central region, and mass flow is reduced because of the $\frac{1}{T}$ temperature dependence. Temperature differences may thus be increased during the air heating process. The temperature differences will to a certain degree be reduced by sideways heat conduction in the material, but due to the hexagonal structure, sideways conductivity is about half of the longitudinal one.

Heat transfer SiC – air is calculated assuming the same flow and temperature in all channels. With T_s & T_a representing absolute temperatures in SiC & air; Q_s heat current in SiC, Q_{s0} front surface value, the equations governing the heat transfer with the assumptions mentioned above are given in [27]:

$$Q_s = \Lambda . \frac{dT_s}{dx}, \tag{14}$$

Λ is longitudinal heat conductivity of absorber material times its total cross section. The derivation is relative to distance x from receiver surface.

$$\frac{dQ_s}{dx} = H.(T_s - T_a) \tag{15}$$

Where $H = h.L$, h is heat transfer coefficient and L total inside wall length of channels.

$$Q_{s0} - Q_s = J.(T_a - T_{amb}) \tag{16}$$

Where T_{amb} is ambient temperature, $J = \dot{m}.c_P$ (air mass flow rate times its heat capacity).

By derivations and substitutions these equations can be converted to an equation in the variable part of T_s:

$$\frac{d^2Y}{dx^2} + a.\frac{dY}{dx} - b.Y = 0 \tag{17}$$

Where $Y = T_s - T_{amb} - \frac{Q_{s0}}{J}$, $a = \frac{H}{J}$ and $b = \frac{H}{\Lambda}$

Assuming constant coefficients, the acceptable solution of this equation is

$$Y = Y_o.\exp(-\alpha.x) \tag{18}$$

Where $$\alpha = \frac{\sqrt{a^2 + 4b} + a}{2}$$

A solution to the model in [27] indicated in eqs. (14 to17) is shown in the chart presented in Figure 9. From this chart, the air cooling effect on the receiver with an increased mass flow rate can be noted, with the receiver presenting lower temperatures for the case of higher mass flow rate.

As discussed above, the model is based on a homogeneous heating on the top and the same air flow through all channels. The first condition is not satisfied giving also unequal flow, amplified by the fact that the viscosity of air increases with temperature, giving higher flow through the cooler parts. SiC thermal resistance is temperature dependent, and the curves in Fig. 9 are calculated using data for siliconized SiC given in [28]; 40 W/ (m.K) at 25 °C, 15 W/(m.K) at 630°C.

By using standard models as discussed e.g. in [26], we find α = 46 and 57 m^{-1} at absolute temperature 600 and 1000 K, respectively. This means that the 1/e-length is of the order of 2 cm for the variable Y. A value of 50 W/(m.K) was assumed for the material heat conductivity, probably a too high value. In reality, the coefficients are functions of x through T_a and T_s; thus, we have a nonlinear equation that must be solved numerically. The model should ideally also be extended to include a realistic distribution of the focused solar radiation on the absorber surface.

© 2017 Global Journals Inc. (US)

The numerical solution to the equation is shown below:

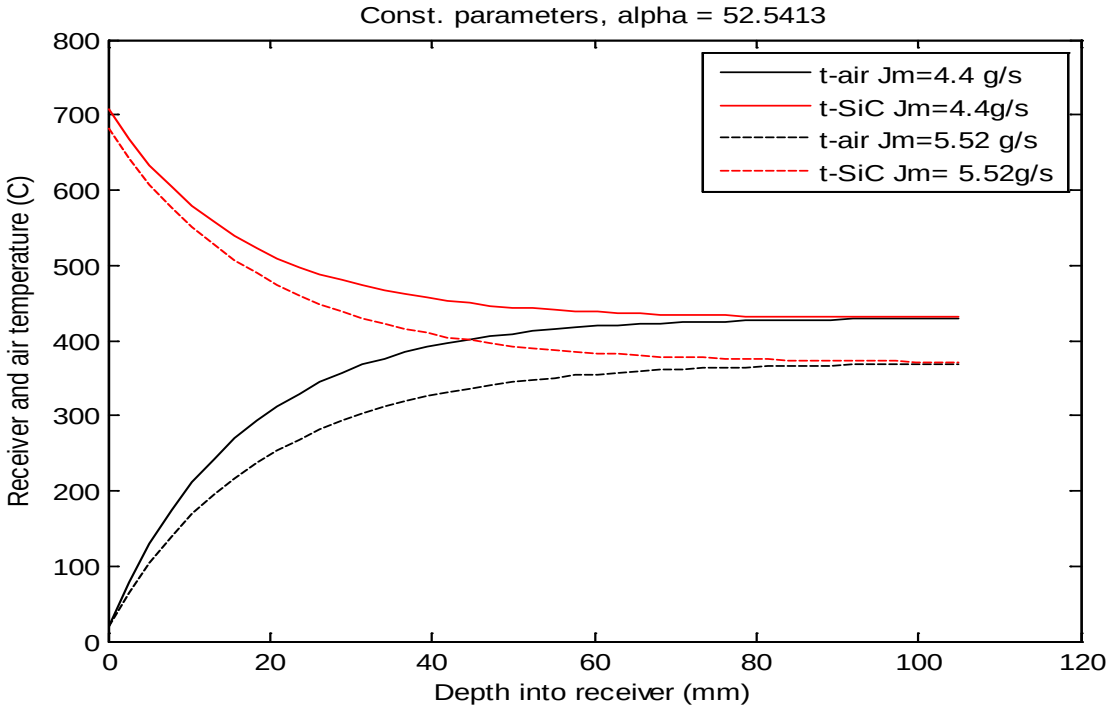

Figure 9: Modeled temperature dependence in air and receiver material to depth of the absorber for the two rates mass flow

The above discussion shows that the absorber should be as narrow as possible, still catching most of the incoming radiation. It should be made of a material with very high heat conductivity to allow transversal temperature equalization and avoid cool air an easy flow in the peripheral channels to mix with the hotter air from the inner ones. Good heat conductivity will also reduce the front temperature. A model should be made to optimize the receiver, both with respect to pumping power and heat loss.

The shape of the present receiver allows easy flow of cool air in the outer parts, and reduces mass flow of hot air in the central part, mixing at the output. This gives higher heat loss and increased pumping power for a given flow and temperature of air output.

It should be noted that for the experiments performed under the two different air mass flow rates, the transient behavior of thermal efficiency indicate a fairly good performance in both cases with the average thermal efficiency around 70 %.

Thus, the efficiencies are about the same which enables the user to choose the relevant temperature optimal for the application by selecting the air flow from the heat conservation. This evidence suggests that, Honeycomb SiC absorber, despite the economic concerns around it as compared to some of its competitor materials, holds a potential to be used as an absorber for PDSC in small scale applications like solar cooker with HS.

In the present study the overall heat loss coefficient was found to be absorber temperature dependent as discussed in [30]. However its average value was found to be around $51.22\ W/m^2K$. The average pressure drop through the receiver was found to be around 330.2 Pa for the first test, which implies a fan power of 4.416 W.

V. Conclusion

Thermal performance of a point focus concentrating solar collector comprising a 2000 mm diameter parabolic dish concentrator covered with reflective aluminum tiles of 0.9 reflectivity and a focal length of 665 mm and SIC honeycomb volumetric absorber, which use atmospheric air as HTF is experimentally investigated. The absorber was tested for two different mass flow rates in order to evaluate its potential as absorber material for solar cooker prototype with HS. The results indicate that the increase in flow rate leads to decrease in the temperature of HTF. Besides, the two flow rates gave a considerable good collector thermal efficiency of around 70%. The results of this study, concerning both high temperatures and efficiency show that an air based solar cooker is possible. However, further tests are required to assure this possibility.

Global Journals Inc. (US) Guidelines Handbook 2017

www.GlobalJournals.org

FELLOWS

FELLOW OF ASSOCIATION OF RESEARCH SOCIETY IN SCIENCE (FARSS)

Global Journals Incorporate (USA) is accredited by Open Association of Research Society (OARS), U.S.A and in turn, awards "FARSS" title to individuals. The 'FARSS' title is accorded to a selected professional after the approval of the Editor-in-Chief/Editorial Board Members/Dean.

- The "FARSS" is a dignified title which is accorded to a person's name viz. Dr. John E. Hall, Ph.D., FARSS or William Walldroff, M.S., FARSS.

FARSS accrediting is an honor. It authenticates your research activities. After recognition as FARSB, you can add 'FARSS' title with your name as you use this recognition as additional suffix to your status. This will definitely enhance and add more value and repute to your name. You may use it on your professional Counseling Materials such as CV, Resume, and Visiting Card etc.

The following benefits can be availed by you only for next three years from the date of certification:

FARSS designated members are entitled to avail a 40% discount while publishing their research papers (of a single author) with Global Journals Incorporation (USA), if the same is accepted by Editorial Board/Peer Reviewers. If you are a main author or co-author in case of multiple authors, you will be entitled to avail discount of 10%.

Once FARSB title is accorded, the Fellow is authorized to organize a symposium/seminar/conference on behalf of Global Journal Incorporation (USA). The Fellow can also participate in conference/seminar/symposium organized by another institution as representative of Global Journal. In both the cases, it is mandatory for him to discuss with us and obtain our consent.

You may join as member of the Editorial Board of Global Journals Incorporation (USA) after successful completion of three years as Fellow and as Peer Reviewer. In addition, it is also desirable that you should organize seminar/symposium/conference at least once.

We shall provide you intimation regarding launching of e-version of journal of your stream time to time.This may be utilized in your library for the enrichment of knowledge of your students as well as it can also be helpful for the concerned faculty members.

The FARSS can go through standards of OARS. You can also play vital role if you have any suggestions so that proper amendment can take place to improve the same for the benefit of entire research community.

As FARSS, you will be given a renowned, secure and free professional email address with 100 GB of space e.g. johnhall@globaljournals.org. This will include Webmail, Spam Assassin, Email Forwarders,Auto-Responders, Email Delivery Route tracing, etc.

The FARSS will be eligible for a free application of standardization of their researches. Standardization of research will be subject to acceptability within stipulated norms as the next step after publishing in a journal. We shall depute a team of specialized research professionals who will render their services for elevating your researches to next higher level, which is worldwide open standardization.

The FARSS member can apply for grading and certification of standards of their educational and Institutional Degrees to Open Association of Research, Society U.S.A.
Once you are designated as FARSS, you may send us a scanned copy of all of your credentials. OARS will verify, grade and certify them. This will be based on your academic records, quality of research papers published by you, and some more criteria. After certification of all your credentials by OARS, they will be published on your Fellow Profile link on website https://associationofresearch.org which will be helpful to upgrade the dignity.

The FARSS members can avail the benefits of free research podcasting in Global Research Radio with their research documents. After publishing the work, (including published elsewhere worldwide with proper authorization) you can upload your research paper with your recorded voice or you can utilize chargeable services of our professional RJs to record your paper in their voice on request.

The FARSS member also entitled to get the benefits of free research podcasting of their research documents through video clips. We can also streamline your conference videos and display your slides/ online slides and online research video clips at reasonable charges, on request.

© Copyright by Global Journals Inc.(US)| Guidelines Handbook

The FARSS is eligible to earn from sales proceeds of his/her researches/reference/review Books or literature, while publishing with Global Journals. The FARSS can decide whether he/she would like to publish his/her research in a closed manner. In this case, whenever readers purchase that individual research paper for reading, maximum 60% of its profit earned as royalty by Global Journals, will be credited to his/her bank account. The entire entitled amount will be credited to his/her bank account exceeding limit of minimum fixed balance. There is no minimum time limit for collection. The FARSS member can decide its price and we can help in making the right decision.

The FARSS member is eligible to join as a paid peer reviewer at Global Journals Incorporation (USA) and can get remuneration of 15% of author fees, taken from the author of a respective paper. After reviewing 5 or more papers you can request to transfer the amount to your bank account.

MEMBER OF ASSOCIATION OF RESEARCH SOCIETY IN SCIENCE (MARSS)

The ' MARSS ' title is accorded to a selected professional after the approval of the Editor-in-Chief / Editorial Board Members/Dean.

The "MARSS" is a dignified ornament which is accorded to a person's name viz. Dr. John E. Hall, Ph.D., MARSS or William Walldroff, M.S., MARSS.

MARSS accrediting is an honor. It authenticates your research activities. After becoming MARSS, you can add 'MARSS' title with your name as you use this recognition as additional suffix to your status. This will definitely enhance and add more value and repute to your name. You may use it on your professional Counseling Materials such as CV, Resume, Visiting Card and Name Plate etc.

The following benefitscan be availed by you only for next three years from the date of certification.

MARSS designated members are entitled to avail a 25% discount while publishing their research papers (of a single author) in Global Journals Inc., if the same is accepted by our Editorial Board and Peer Reviewers. If you are a main author or co-author of a group of authors, you will get discount of 10%.

As MARSS, you will be given a renowned, secure and free professional email address with 30 GB of space e.g. johnhall@globaljournals.org. This will include Webmail, Spam Assassin, Email Forwarders,Auto-Responders, Email Delivery Route tracing, etc.

We shall provide you intimation regarding launching of e-version of journal of your stream time to time.This may be utilized in your library for the enrichment of knowledge of your students as well as it can also be helpful for the concerned faculty members.

The MARSS member can apply for approval, grading and certification of standards of their educational and Institutional Degrees to Open Association of Research, Society U.S.A.

Once you are designated as MARSS, you may send us a scanned copy of all of your credentials. OARS will verify, grade and certify them. This will be based on your academic records, quality of research papers published by you, and some more criteria.

It is mandatory to read all terms and conditions carefully.

AUXILIARY MEMBERSHIPS

Institutional Fellow of Global Journals Incorporation (USA)-OARS (USA)

Global Journals Incorporation (USA) is accredited by Open Association of Research Society, U.S.A (OARS) and in turn, affiliates research institutions as "Institutional Fellow of Open Association of Research Society" (IFOARS).

The "FARSC" is a dignified title which is accorded to a person's name viz. Dr. John E. Hall, Ph.D., FARSC or William Walldroff, M.S., FARSC.

The IFOARS institution is entitled to form a Board comprised of one Chairperson and three to five board members preferably from different streams. The Board will be recognized as "Institutional Board of Open Association of Research Society"-(IBOARS).

The Institute will be entitled to following benefits:

The IBOARS can initially review research papers of their institute and recommend them to publish with respective journal of Global Journals. It can also review the papers of other institutions after obtaining our consent. The second review will be done by peer reviewer of Global Journals Incorporation (USA) The Board is at liberty to appoint a peer reviewer with the approval of chairperson after consulting us.

The author fees of such paper may be waived off up to 40%.

The Global Journals Incorporation (USA) at its discretion can also refer double blind peer reviewed paper at their end to the board for the verification and to get recommendation for final stage of acceptance of publication.

The IBOARS can organize symposium/seminar/conference in their country on behalf of Global Journals Incorporation (USA)-OARS (USA). The terms and conditions can be discussed separately.

The Board can also play vital role by exploring and giving valuable suggestions regarding the Standards of "Open Association of Research Society, U.S.A (OARS)" so that proper amendment can take place for the benefit of entire research community. We shall provide details of particular standard only on receipt of request from the Board.

The board members can also join us as Individual Fellow with 40% discount on total fees applicable to Individual Fellow. They will be entitled to avail all the benefits as declared. Please visit Individual Fellow-sub menu of GlobalJournals.org to have more relevant details.

© Copyright by Global Journals Inc.(US) | Guidelines Handbook

We shall provide you intimation regarding launching of e-version of journal of your stream time to time. This may be utilized in your library for the enrichment of knowledge of your students as well as it can also be helpful for the concerned faculty members.

After nomination of your institution as "Institutional Fellow" and constantly functioning successfully for one year, we can consider giving recognition to your institute to function as Regional/Zonal office on our behalf.
The board can also take up the additional allied activities for betterment after our consultation.

The following entitlements are applicable to individual Fellows:

Open Association of Research Society, U.S.A (OARS) By-laws states that an individual Fellow may use the designations as applicable, or the corresponding initials. The Credentials of individual Fellow and Associate designations signify that the individual has gained knowledge of the fundamental concepts. One is magnanimous and proficient in an expertise course covering the professional code of conduct, and follows recognized standards of practice.

Open Association of Research Society (US)/ Global Journals Incorporation (USA), as described in Corporate Statements, are educational, research publishing and professional membership organizations. Achieving our individual Fellow or Associate status is based mainly on meeting stated educational research requirements.

Disbursement of 40% Royalty earned through Global Journals : Researcher = 50%, Peer Reviewer = 37.50%, Institution = 12.50% E.g. Out of 40%, the 20% benefit should be passed on to researcher, 15 % benefit towards remuneration should be given to a reviewer and remaining 5% is to be retained by the institution.

We shall provide print version of 12 issues of any three journals [as per your requirement] out of our 38 journals worth $ 2376 USD.

Other:

The individual Fellow and Associate designations accredited by Open Association of Research Society (US) credentials signify guarantees following achievements:

- The professional accredited with Fellow honor, is entitled to various benefits viz. name, fame, honor, regular flow of income, secured bright future, social status etc.

© Copyright by Global Journals Inc.(US)| Guidelines Handbook

- In addition to above, if one is single author, then entitled to 40% discount on publishing research paper and can get 10%discount if one is co-author or main author among group of authors.
- The Fellow can organize symposium/seminar/conference on behalf of Global Journals Incorporation (USA) and he/she can also attend the same organized by other institutes on behalf of Global Journals.
- The Fellow can become member of Editorial Board Member after completing 3yrs.
- The Fellow can earn 60% of sales proceeds from the sale of reference/review books/literature/publishing of research paper.
- Fellow can also join as paid peer reviewer and earn 15% remuneration of author charges and can also get an opportunity to join as member of the Editorial Board of Global Journals Incorporation (USA)
- • This individual has learned the basic methods of applying those concepts and techniques to common challenging situations. This individual has further demonstrated an in–depth understanding of the application of suitable techniques to a particular area of research practice.

Note :

"

- In future, if the board feels the necessity to change any board member, the same can be done with the consent of the chairperson along with anyone board member without our approval.
- In case, the chairperson needs to be replaced then consent of 2/3rd board members are required and they are also required to jointly pass the resolution copy of which should be sent to us. In such case, it will be compulsory to obtain our approval before replacement.
- In case of "Difference of Opinion [if any]" among the Board members, our decision will be final and binding to everyone.

"

Process of submission of Research Paper

The Area or field of specialization may or may not be of any category as mentioned in 'Scope of Journal' menu of the GlobalJournals.org website. There are 37 Research Journal categorized with Six parental Journals GJCST, GJMR, GJRE, GJMBR, GJSFR, GJHSS. For Authors should prefer the mentioned categories. There are three widely used systems UDC, DDC and LCC. The details are available as 'Knowledge Abstract' at Home page. The major advantage of this coding is that, the research work will be exposed to and shared with all over the world as we are being abstracted and indexed worldwide.

The paper should be in proper format. The format can be downloaded from first page of 'Author Guideline' Menu. The Author is expected to follow the general rules as mentioned in this menu. The paper should be written in MS-Word Format (*.DOC,*.DOCX).

The Author can submit the paper either online or offline. The authors should prefer online submission.Online Submission: There are three ways to submit your paper:

(A) (I) First, register yourself using top right corner of Home page then Login. If you are already registered, then login using your username and password.

(II) Choose corresponding Journal.

(III) Click 'Submit Manuscript'. Fill required information and Upload the paper.

(B) If you are using Internet Explorer, then Direct Submission through Homepage is also available.

(C) If these two are not conveninet , and then email the paper directly to dean@globaljournals.org.

Offline Submission: Author can send the typed form of paper by Post. However, online submission should be preferred.

Preferred Author Guidelines

MANUSCRIPT STYLE INSTRUCTION (Must be strictly followed)

Page Size: 8.27" X 11'"

- Left Margin: 0.65
- Right Margin: 0.65
- Top Margin: 0.75
- Bottom Margin: 0.75
- Font type of all text should be Swis 721 Lt BT.
- Paper Title should be of Font Size 24 with one Column section.
- Author Name in Font Size of 11 with one column as of Title.
- Abstract Font size of 9 Bold, "Abstract" word in Italic Bold.
- Main Text: Font size 10 with justified two columns section
- Two Column with Equal Column with of 3.38 and Gaping of .2
- First Character must be three lines Drop capped.
- Paragraph before Spacing of 1 pt and After of 0 pt.
- Line Spacing of 1 pt
- Large Images must be in One Column
- Numbering of First Main Headings (Heading 1) must be in Roman Letters, Capital Letter, and Font Size of 10.
- Numbering of Second Main Headings (Heading 2) must be in Alphabets, Italic, and Font Size of 10.

You can use your own standard format also.
Author Guidelines:

1. General,

2. Ethical Guidelines,

3. Submission of Manuscripts,

4. Manuscript's Category,

5. Structure and Format of Manuscript,

6. After Acceptance.

1. GENERAL

Before submitting your research paper, one is advised to go through the details as mentioned in following heads. It will be beneficial, while peer reviewer justify your paper for publication.

Scope

The Global Journals Inc. (US) welcome the submission of original paper, review paper, survey article relevant to the all the streams of Philosophy and knowledge. The Global Journals Inc. (US) is parental platform for Global Journal of Computer Science and Technology, Researches in Engineering, Medical Research, Science Frontier Research, Human Social Science, Management, and Business organization. The choice of specific field can be done otherwise as following in Abstracting and Indexing Page on this Website. As the all Global

Journals Inc. (US) are being abstracted and indexed (in process) by most of the reputed organizations. Topics of only narrow interest will not be accepted unless they have wider potential or consequences.

2. ETHICAL GUIDELINES

Authors should follow the ethical guidelines as mentioned below for publication of research paper and research activities.

Papers are accepted on strict understanding that the material in whole or in part has not been, nor is being, considered for publication elsewhere. If the paper once accepted by Global Journals Inc. (US) and Editorial Board, will become the copyright of the Global Journals Inc. (US).

Authorship: The authors and coauthors should have active contribution to conception design, analysis and interpretation of findings. They should critically review the contents and drafting of the paper. All should approve the final version of the paper before submission

The Global Journals Inc. (US) follows the definition of authorship set up by the Global Academy of Research and Development. According to the Global Academy of R&D authorship, criteria must be based on:

1) Substantial contributions to conception and acquisition of data, analysis and interpretation of the findings.

2) Drafting the paper and revising it critically regarding important academic content.

3) Final approval of the version of the paper to be published.

All authors should have been credited according to their appropriate contribution in research activity and preparing paper. Contributors who do not match the criteria as authors may be mentioned under Acknowledgement.

Acknowledgements: Contributors to the research other than authors credited should be mentioned under acknowledgement. The specifications of the source of funding for the research if appropriate can be included. Suppliers of resources may be mentioned along with address.

Appeal of Decision: The Editorial Board's decision on publication of the paper is final and cannot be appealed elsewhere.

Permissions: It is the author's responsibility to have prior permission if all or parts of earlier published illustrations are used in this paper.

Please mention proper reference and appropriate acknowledgements wherever expected.

If all or parts of previously published illustrations are used, permission must be taken from the copyright holder concerned. It is the author's responsibility to take these in writing.

Approval for reproduction/modification of any information (including figures and tables) published elsewhere must be obtained by the authors/copyright holders before submission of the manuscript. Contributors (Authors) are responsible for any copyright fee involved.

3. SUBMISSION OF MANUSCRIPTS

Manuscripts should be uploaded via this online submission page. The online submission is most efficient method for submission of papers, as it enables rapid distribution of manuscripts and consequently speeds up the review procedure. It also enables authors to know the status of their own manuscripts by emailing us. Complete instructions for submitting a paper is available below.

Manuscript submission is a systematic procedure and little preparation is required beyond having all parts of your manuscript in a given format and a computer with an Internet connection and a Web browser. Full help and instructions are provided on-screen. As an author, you will be prompted for login and manuscript details as Field of Paper and then to upload your manuscript file(s) according to the instructions.

To avoid postal delays, all transaction is preferred by e-mail. A finished manuscript submission is confirmed by e-mail immediately and your paper enters the editorial process with no postal delays. When a conclusion is made about the publication of your paper by our Editorial Board, revisions can be submitted online with the same procedure, with an occasion to view and respond to all comments.

Complete support for both authors and co-author is provided.

4. MANUSCRIPT'S CATEGORY

Based on potential and nature, the manuscript can be categorized under the following heads:

Original research paper: Such papers are reports of high-level significant original research work.

Review papers: These are concise, significant but helpful and decisive topics for young researchers.

Research articles: These are handled with small investigation and applications

Research letters: The letters are small and concise comments on previously published matters.

5.STRUCTURE AND FORMAT OF MANUSCRIPT

The recommended size of original research paper is less than seven thousand words, review papers fewer than seven thousands words also.Preparation of research paper or how to write research paper, are major hurdle, while writing manuscript. The research articles and research letters should be fewer than three thousand words, the structure original research paper; sometime review paper should be as follows:

Papers: These are reports of significant research (typically less than 7000 words equivalent, including tables, figures, references), and comprise:

(a)Title should be relevant and commensurate with the theme of the paper.

(b) A brief Summary, "Abstract" (less than 150 words) containing the major results and conclusions.

(c) Up to ten keywords, that precisely identifies the paper's subject, purpose, and focus.

(d) An Introduction, giving necessary background excluding subheadings; objectives must be clearly declared.

(e) Resources and techniques with sufficient complete experimental details (wherever possible by reference) to permit repetition; sources of information must be given and numerical methods must be specified by reference, unless non-standard.

(f) Results should be presented concisely, by well-designed tables and/or figures; the same data may not be used in both; suitable statistical data should be given. All data must be obtained with attention to numerical detail in the planning stage. As reproduced design has been recognized to be important to experiments for a considerable time, the Editor has decided that any paper that appears not to have adequate numerical treatments of the data will be returned un-refereed;

(g) Discussion should cover the implications and consequences, not just recapitulating the results; conclusions should be summarizing.

(h) Brief Acknowledgements.

(i) References in the proper form.

Authors should very cautiously consider the preparation of papers to ensure that they communicate efficiently. Papers are much more likely to be accepted, if they are cautiously designed and laid out, contain few or no errors, are summarizing, and be conventional to the approach and instructions. They will in addition, be published with much less delays than those that require much technical and editorial correction.

The Editorial Board reserves the right to make literary corrections and to make suggestions to improve briefness.

It is vital, that authors take care in submitting a manuscript that is written in simple language and adheres to published guidelines.

Format

Language: The language of publication is UK English. Authors, for whom English is a second language, must have their manuscript efficiently edited by an English-speaking person before submission to make sure that, the English is of high excellence. It is preferable, that manuscripts should be professionally edited.

Standard Usage, Abbreviations, and Units: Spelling and hyphenation should be conventional to The Concise Oxford English Dictionary. Statistics and measurements should at all times be given in figures, e.g. 16 min, except for when the number begins a sentence. When the number does not refer to a unit of measurement it should be spelt in full unless, it is 160 or greater.

Abbreviations supposed to be used carefully. The abbreviated name or expression is supposed to be cited in full at first usage, followed by the conventional abbreviation in parentheses.

Metric SI units are supposed to generally be used excluding where they conflict with current practice or are confusing. For illustration, 1.4 l rather than 1.4 × 10-3 m3, or 4 mm somewhat than 4 × 10-3 m. Chemical formula and solutions must identify the form used, e.g. anhydrous or hydrated, and the concentration must be in clearly defined units. Common species names should be followed by underlines at the first mention. For following use the generic name should be constricted to a single letter, if it is clear.

Structure

All manuscripts submitted to Global Journals Inc. (US), ought to include:

Title: The title page must carry an instructive title that reflects the content, a running title (less than 45 characters together with spaces), names of the authors and co-authors, and the place(s) wherever the work was carried out. The full postal address in addition with the e-mail address of related author must be given. Up to eleven keywords or very brief phrases have to be given to help data retrieval, mining and indexing.

Abstract, used in Original Papers and Reviews:

Optimizing Abstract for Search Engines

Many researchers searching for information online will use search engines such as Google, Yahoo or similar. By optimizing your paper for search engines, you will amplify the chance of someone finding it. This in turn will make it more likely to be viewed and/or cited in a further work. Global Journals Inc. (US) have compiled these guidelines to facilitate you to maximize the web-friendliness of the most public part of your paper.

Key Words

A major linchpin in research work for the writing research paper is the keyword search, which one will employ to find both library and Internet resources.

One must be persistent and creative in using keywords. An effective keyword search requires a strategy and planning a list of possible keywords and phrases to try.

Search engines for most searches, use Boolean searching, which is somewhat different from Internet searches. The Boolean search uses "operators," words (and, or, not, and near) that enable you to expand or narrow your affords. Tips for research paper while preparing research paper are very helpful guideline of research paper.

Choice of key words is first tool of tips to write research paper. Research paper writing is an art.A few tips for deciding as strategically as possible about keyword search:

- One should start brainstorming lists of possible keywords before even begin searching. Think about the most important concepts related to research work. Ask, "What words would a source have to include to be truly valuable in research paper?" Then consider synonyms for the important words.
- It may take the discovery of only one relevant paper to let steer in the right keyword direction because in most databases, the keywords under which a research paper is abstracted are listed with the paper.
- One should avoid outdated words.

Keywords are the key that opens a door to research work sources. Keyword searching is an art in which researcher's skills are bound to improve with experience and time.

Numerical Methods: Numerical methods used should be clear and, where appropriate, supported by references.

Acknowledgements: Please make these as concise as possible.

References

References follow the Harvard scheme of referencing. References in the text should cite the authors' names followed by the time of their publication, unless there are three or more authors when simply the first author's name is quoted followed by et al. unpublished work has to only be cited where necessary, and only in the text. Copies of references in press in other journals have to be supplied with submitted typescripts. It is necessary that all citations and references be carefully checked before submission, as mistakes or omissions will cause delays.

References to information on the World Wide Web can be given, but only if the information is available without charge to readers on an official site. Wikipedia and Similar websites are not allowed where anyone can change the information. Authors will be asked to make available electronic copies of the cited information for inclusion on the Global Journals Inc. (US) homepage at the judgment of the Editorial Board.

The Editorial Board and Global Journals Inc. (US) recommend that, citation of online-published papers and other material should be done via a DOI (digital object identifier). If an author cites anything, which does not have a DOI, they run the risk of the cited material not being noticeable.

The Editorial Board and Global Journals Inc. (US) recommend the use of a tool such as Reference Manager for reference management and formatting.

Tables, Figures and Figure Legends

Tables: Tables should be few in number, cautiously designed, uncrowned, and include only essential data. Each must have an Arabic number, e.g. Table 4, a self-explanatory caption and be on a separate sheet. Vertical lines should not be used.

Figures: Figures are supposed to be submitted as separate files. Always take in a citation in the text for each figure using Arabic numbers, e.g. Fig. 4. Artwork must be submitted online in electronic form by e-mailing them.

Preparation of Electronic Figures for Publication

Even though low quality images are sufficient for review purposes, print publication requires high quality images to prevent the final product being blurred or fuzzy. Submit (or e-mail) EPS (line art) or TIFF (halftone/photographs) files only. MS PowerPoint and Word Graphics are unsuitable for printed pictures. Do not use pixel-oriented software. Scans (TIFF only) should have a resolution of at least 350 dpi (halftone) or 700 to 1100 dpi (line drawings) in relation to the imitation size. Please give the data for figures in black and white or submit a Color Work Agreement Form. EPS files must be saved with fonts embedded (and with a TIFF preview, if possible).

For scanned images, the scanning resolution (at final image size) ought to be as follows to ensure good reproduction: line art: >650 dpi; halftones (including gel photographs) : >350 dpi; figures containing both halftone and line images: >650 dpi.

Color Charges: It is the rule of the Global Journals Inc. (US) for authors to pay the full cost for the reproduction of their color artwork. Hence, please note that, if there is color artwork in your manuscript when it is accepted for publication, we would require you to complete and return a color work agreement form before your paper can be published.

Figure Legends: Self-explanatory legends of all figures should be incorporated separately under the heading 'Legends to Figures'. In the full-text online edition of the journal, figure legends may possibly be truncated in abbreviated links to the full screen version. Therefore, the first 100 characters of any legend should notify the reader, about the key aspects of the figure.

6. AFTER ACCEPTANCE

Upon approval of a paper for publication, the manuscript will be forwarded to the dean, who is responsible for the publication of the Global Journals Inc. (US).

6.1 Proof Corrections

The corresponding author will receive an e-mail alert containing a link to a website or will be attached. A working e-mail address must therefore be provided for the related author.

Acrobat Reader will be required in order to read this file. This software can be downloaded

(Free of charge) from the following website:

www.adobe.com/products/acrobat/readstep2.html. This will facilitate the file to be opened, read on screen, and printed out in order for any corrections to be added. Further instructions will be sent with the proof.

Proofs must be returned to the dean at dean@globaljournals.org within three days of receipt.

As changes to proofs are costly, we inquire that you only correct typesetting errors. All illustrations are retained by the publisher. Please note that the authors are responsible for all statements made in their work, including changes made by the copy editor.

6.2 Early View of Global Journals Inc. (US) (Publication Prior to Print)

The Global Journals Inc. (US) are enclosed by our publishing's Early View service. Early View articles are complete full-text articles sent in advance of their publication. Early View articles are absolute and final. They have been completely reviewed, revised and edited for publication, and the authors' final corrections have been incorporated. Because they are in final form, no changes can be made after sending them. The nature of Early View articles means that they do not yet have volume, issue or page numbers, so Early View articles cannot be cited in the conventional way.

6.3 Author Services

Online production tracking is available for your article through Author Services. Author Services enables authors to track their article - once it has been accepted - through the production process to publication online and in print. Authors can check the status of their articles online and choose to receive automated e-mails at key stages of production. The authors will receive an e-mail with a unique link that enables them to register and have their article automatically added to the system. Please ensure that a complete e-mail address is provided when submitting the manuscript.

6.4 Author Material Archive Policy

Please note that if not specifically requested, publisher will dispose off hardcopy & electronic information submitted, after the two months of publication. If you require the return of any information submitted, please inform the Editorial Board or dean as soon as possible.

6.5 Offprint and Extra Copies

A PDF offprint of the online-published article will be provided free of charge to the related author, and may be distributed according to the Publisher's terms and conditions. Additional paper offprint may be ordered by emailing us at: editor@globaljournals.org .

Before start writing a good quality Computer Science Research Paper, let us first understand what is Computer Science Research Paper? So, Computer Science Research Paper is the paper which is written by professionals or scientists who are associated to Computer Science and Information Technology, or doing research study in these areas. If you are novel to this field then you can consult about this field from your supervisor or guide.

TECHNIQUES FOR WRITING A GOOD QUALITY RESEARCH PAPER:

1. Choosing the topic: In most cases, the topic is searched by the interest of author but it can be also suggested by the guides. You can have several topics and then you can judge that in which topic or subject you are finding yourself most comfortable. This can be done by asking several questions to yourself, like Will I be able to carry our search in this area? Will I find all necessary recourses to accomplish the search? Will I be able to find all information in this field area? If the answer of these types of questions will be "Yes" then you can choose that topic. In most of the cases, you may have to conduct the surveys and have to visit several places because this field is related to Computer Science and Information Technology. Also, you may have to do a lot of work to find all rise and falls regarding the various data of that subject. Sometimes, detailed information plays a vital role, instead of short information.

2. Evaluators are human: First thing to remember that evaluators are also human being. They are not only meant for rejecting a paper. They are here to evaluate your paper. So, present your Best.

3. Think Like Evaluators: If you are in a confusion or getting demotivated that your paper will be accepted by evaluators or not, then think and try to evaluate your paper like an Evaluator. Try to understand that what an evaluator wants in your research paper and automatically you will have your answer.

4. Make blueprints of paper: The outline is the plan or framework that will help you to arrange your thoughts. It will make your paper logical. But remember that all points of your outline must be related to the topic you have chosen.

5. Ask your Guides: If you are having any difficulty in your research, then do not hesitate to share your difficulty to your guide (if you have any). They will surely help you out and resolve your doubts. If you can't clarify what exactly you require for your work then ask the supervisor to help you with the alternative. He might also provide you the list of essential readings.

6. Use of computer is recommended: As you are doing research in the field of Computer Science, then this point is quite obvious.

7. Use right software: Always use good quality software packages. If you are not capable to judge good software then you can lose quality of your paper unknowingly. There are various software programs available to help you, which you can get through Internet.

8. Use the Internet for help: An excellent start for your paper can be by using the Google. It is an excellent search engine, where you can have your doubts resolved. You may also read some answers for the frequent question how to write my research paper or find model research paper. From the internet library you can download books. If you have all required books make important reading selecting and analyzing the specified information. Then put together research paper sketch out.

9. Use and get big pictures: Always use encyclopedias, Wikipedia to get pictures so that you can go into the depth.

10. Bookmarks are useful: When you read any book or magazine, you generally use bookmarks, right! It is a good habit, which helps to not to lose your continuity. You should always use bookmarks while searching on Internet also, which will make your search easier.

11. Revise what you wrote: When you write anything, always read it, summarize it and then finalize it.

12. Make all efforts: Make all efforts to mention what you are going to write in your paper. That means always have a good start. Try to mention everything in introduction, that what is the need of a particular research paper. Polish your work by good skill of writing and always give an evaluator, what he wants.

13. Have backups: When you are going to do any important thing like making research paper, you should always have backup copies of it either in your computer or in paper. This will help you to not to lose any of your important.

14. Produce good diagrams of your own: Always try to include good charts or diagrams in your paper to improve quality. Using several and unnecessary diagrams will degrade the quality of your paper by creating "hotchpotch." So always, try to make and include those diagrams, which are made by your own to improve readability and understandability of your paper.

15. Use of direct quotes: When you do research relevant to literature, history or current affairs then use of quotes become essential but if study is relevant to science then use of quotes is not preferable.

16. Use proper verb tense: Use proper verb tenses in your paper. Use past tense, to present those events that happened. Use present tense to indicate events that are going on. Use future tense to indicate future happening events. Use of improper and wrong tenses will confuse the evaluator. Avoid the sentences that are incomplete.

17. Never use online paper: If you are getting any paper on Internet, then never use it as your research paper because it might be possible that evaluator has already seen it or maybe it is outdated version.

18. Pick a good study spot: To do your research studies always try to pick a spot, which is quiet. Every spot is not for studies. Spot that suits you choose it and proceed further.

19. Know what you know: Always try to know, what you know by making objectives. Else, you will be confused and cannot achieve your target.

20. Use good quality grammar: Always use a good quality grammar and use words that will throw positive impact on evaluator. Use of good quality grammar does not mean to use tough words, that for each word the evaluator has to go through dictionary. Do not start sentence with a conjunction. Do not fragment sentences. Eliminate one-word sentences. Ignore passive voice. Do not ever use a big word when a diminutive one would suffice. Verbs have to be in agreement with their subjects. Prepositions are not expressions to finish sentences with. It is incorrect to ever divide an infinitive. Avoid clichés like the disease. Also, always shun irritating alliteration. Use language that is simple and straight forward. put together a neat summary.

21. Arrangement of information: Each section of the main body should start with an opening sentence and there should be a changeover at the end of the section. Give only valid and powerful arguments to your topic. You may also maintain your arguments with records.

22. Never start in last minute: Always start at right time and give enough time to research work. Leaving everything to the last minute will degrade your paper and spoil your work.

23. Multitasking in research is not good: Doing several things at the same time proves bad habit in case of research activity. Research is an area, where everything has a particular time slot. Divide your research work in parts and do particular part in particular time slot.

24. Never copy others' work: Never copy others' work and give it your name because if evaluator has seen it anywhere you will be in trouble.

25. Take proper rest and food: No matter how many hours you spend for your research activity, if you are not taking care of your health then all your efforts will be in vain. For a quality research, study is must, and this can be done by taking proper rest and food.

26. Go for seminars: Attend seminars if the topic is relevant to your research area. Utilize all your resources.

© Copyright by Global Journals Inc.(US)| Guidelines Handbook

27. Refresh your mind after intervals: Try to give rest to your mind by listening to soft music or by sleeping in intervals. This will also improve your memory.

28. Make colleagues: Always try to make colleagues. No matter how sharper or intelligent you are, if you make colleagues you can have several ideas, which will be helpful for your research.

29. Think technically: Always think technically. If anything happens, then search its reasons, its benefits, and demerits.

30. Think and then print: When you will go to print your paper, notice that tables are not be split, headings are not detached from their descriptions, and page sequence is maintained.

31. Adding unnecessary information: Do not add unnecessary information, like, I have used MS Excel to draw graph. Do not add irrelevant and inappropriate material. These all will create superfluous. Foreign terminology and phrases are not apropos. One should NEVER take a broad view. Analogy in script is like feathers on a snake. Not at all use a large word when a very small one would be sufficient. Use words properly, regardless of how others use them. Remove quotations. Puns are for kids, not grunt readers. Amplification is a billion times of inferior quality than sarcasm.

32. Never oversimplify everything: To add material in your research paper, never go for oversimplification. This will definitely irritate the evaluator. Be more or less specific. Also too, by no means, ever use rhythmic redundancies. Contractions aren't essential and shouldn't be there used. Comparisons are as terrible as clichés. Give up ampersands and abbreviations, and so on. Remove commas, that are, not necessary. Parenthetical words however should be together with this in commas. Understatement is all the time the complete best way to put onward earth-shaking thoughts. Give a detailed literary review.

33. Report concluded results: Use concluded results. From raw data, filter the results and then conclude your studies based on measurements and observations taken. Significant figures and appropriate number of decimal places should be used. Parenthetical remarks are prohibitive. Proofread carefully at final stage. In the end give outline to your arguments. Spot out perspectives of further study of this subject. Justify your conclusion by at the bottom of them with sufficient justifications and examples.

34. After conclusion: Once you have concluded your research, the next most important step is to present your findings. Presentation is extremely important as it is the definite medium though which your research is going to be in print to the rest of the crowd. Care should be taken to categorize your thoughts well and present them in a logical and neat manner. A good quality research paper format is essential because it serves to highlight your research paper and bring to light all necessary aspects in your research.

Informal Guidelines of Research Paper Writing

Key points to remember:

- Submit all work in its final form.
- Write your paper in the form, which is presented in the guidelines using the template.
- Please note the criterion for grading the final paper by peer-reviewers.

Final Points:

A purpose of organizing a research paper is to let people to interpret your effort selectively. The journal requires the following sections, submitted in the order listed, each section to start on a new page.

The introduction will be compiled from reference matter and will reflect the design processes or outline of basis that direct you to make study. As you will carry out the process of study, the method and process section will be constructed as like that. The result segment will show related statistics in nearly sequential order and will direct the reviewers next to the similar intellectual paths throughout the data that you took to carry out your study. The discussion section will provide understanding of the data and projections as to the implication of the results. The use of good quality references all through the paper will give the effort trustworthiness by representing an alertness of prior workings.

Writing a research paper is not an easy job no matter how trouble-free the actual research or concept. Practice, excellent preparation, and controlled record keeping are the only means to make straightforward the progression.

General style:

Specific editorial column necessities for compliance of a manuscript will always take over from directions in these general guidelines.

To make a paper clear

· Adhere to recommended page limits

Mistakes to evade

- Insertion a title at the foot of a page with the subsequent text on the next page
- Separating a table/chart or figure - impound each figure/table to a single page
- Submitting a manuscript with pages out of sequence

In every sections of your document

· Use standard writing style including articles ("a", "the," etc.)

· Keep on paying attention on the research topic of the paper

· Use paragraphs to split each significant point (excluding for the abstract)

· Align the primary line of each section

· Present your points in sound order

· Use present tense to report well accepted

· Use past tense to describe specific results

· Shun familiar wording, don't address the reviewer directly, and don't use slang, slang language, or superlatives

· Shun use of extra pictures - include only those figures essential to presenting results

Title Page:

Choose a revealing title. It should be short. It should not have non-standard acronyms or abbreviations. It should not exceed two printed lines. It should include the name(s) and address (es) of all authors.

© Copyright by Global Journals Inc.(US)| Guidelines Handbook

Abstract:

The summary should be two hundred words or less. It should briefly and clearly explain the key findings reported in the manuscript--must have precise statistics. It should not have abnormal acronyms or abbreviations. It should be logical in itself. Shun citing references at this point.

An abstract is a brief distinct paragraph summary of finished work or work in development. In a minute or less a reviewer can be taught the foundation behind the study, common approach to the problem, relevant results, and significant conclusions or new questions.

Write your summary when your paper is completed because how can you write the summary of anything which is not yet written? Wealth of terminology is very essential in abstract. Yet, use comprehensive sentences and do not let go readability for briefness. You can maintain it succinct by phrasing sentences so that they provide more than lone rationale. The author can at this moment go straight to shortening the outcome. Sum up the study, with the subsequent elements in any summary. Try to maintain the initial two items to no more than one ruling each.

- Reason of the study - theory, overall issue, purpose
- Fundamental goal
- To the point depiction of the research
- Consequences, including definite statistics - if the consequences are quantitative in nature, account quantitative data; results of any numerical analysis should be reported
- Significant conclusions or questions that track from the research(es)

Approach:

- Single section, and succinct
- As a outline of job done, it is always written in past tense
- A conceptual should situate on its own, and not submit to any other part of the paper such as a form or table
- Center on shortening results - bound background information to a verdict or two, if completely necessary
- What you account in an conceptual must be regular with what you reported in the manuscript
- Exact spelling, clearness of sentences and phrases, and appropriate reporting of quantities (proper units, important statistics) are just as significant in an abstract as they are anywhere else

Introduction:

The **Introduction** should "introduce" the manuscript. The reviewer should be presented with sufficient background information to be capable to comprehend and calculate the purpose of your study without having to submit to other works. The basis for the study should be offered. Give most important references but shun difficult to make a comprehensive appraisal of the topic. In the introduction, describe the problem visibly. If the problem is not acknowledged in a logical, reasonable way, the reviewer will have no attention in your result. Speak in common terms about techniques used to explain the problem, if needed, but do not present any particulars about the protocols here. Following approach can create a valuable beginning:

- Explain the value (significance) of the study
- Shield the model - why did you employ this particular system or method? What is its compensation? You strength remark on its appropriateness from a abstract point of vision as well as point out sensible reasons for using it.
- Present a justification. Status your particular theory (es) or aim(s), and describe the logic that led you to choose them.
- Very for a short time explain the tentative propose and how it skilled the declared objectives.

Approach:

- Use past tense except for when referring to recognized facts. After all, the manuscript will be submitted after the entire job is done.
- Sort out your thoughts; manufacture one key point with every section. If you make the four points listed above, you will need a least of four paragraphs.

- Present surroundings information only as desirable in order hold up a situation. The reviewer does not desire to read the whole thing you know about a topic.
- Shape the theory/purpose specifically - do not take a broad view.
- As always, give awareness to spelling, simplicity and correctness of sentences and phrases.

Procedures (Methods and Materials):

This part is supposed to be the easiest to carve if you have good skills. A sound written Procedures segment allows a capable scientist to replacement your results. Present precise information about your supplies. The suppliers and clarity of reagents can be helpful bits of information. Present methods in sequential order but linked methodologies can be grouped as a segment. Be concise when relating the protocols. Attempt for the least amount of information that would permit another capable scientist to spare your outcome but be cautious that vital information is integrated. The use of subheadings is suggested and ought to be synchronized with the results section. When a technique is used that has been well described in another object, mention the specific item describing a way but draw the basic principle while stating the situation. The purpose is to text all particular resources and broad procedures, so that another person may use some or all of the methods in one more study or referee the scientific value of your work. It is not to be a step by step report of the whole thing you did, nor is a methods section a set of orders.

Materials:

- Explain materials individually only if the study is so complex that it saves liberty this way.
- Embrace particular materials, and any tools or provisions that are not frequently found in laboratories.
- Do not take in frequently found.
- If use of a definite type of tools.
- Materials may be reported in a part section or else they may be recognized along with your measures.

Methods:

- Report the method (not particulars of each process that engaged the same methodology)
- Describe the method entirely
- To be succinct, present methods under headings dedicated to specific dealings or groups of measures
- Simplify - details how procedures were completed not how they were exclusively performed on a particular day.
- If well known procedures were used, account the procedure by name, possibly with reference, and that's all.

Approach:

- It is embarrassed or not possible to use vigorous voice when documenting methods with no using first person, which would focus the reviewer's interest on the researcher rather than the job. As a result when script up the methods most authors use third person passive voice.
- Use standard style in this and in every other part of the paper - avoid familiar lists, and use full sentences.

What to keep away from

- Resources and methods are not a set of information.
- Skip all descriptive information and surroundings - save it for the argument.
- Leave out information that is immaterial to a third party.

Results:

The principle of a results segment is to present and demonstrate your conclusion. Create this part a entirely objective details of the outcome, and save all understanding for the discussion.

The page length of this segment is set by the sum and types of data to be reported. Carry on to be to the point, by means of statistics and tables, if suitable, to present consequences most efficiently.You must obviously differentiate material that would usually be incorporated in a study editorial from any unprocessed data or additional appendix matter that would not be available. In fact, such matter should not be submitted at all except requested by the instructor.

© Copyright by Global Journals Inc.(US)| Guidelines Handbook

Content

- Sum up your conclusion in text and demonstrate them, if suitable, with figures and tables.
- In manuscript, explain each of your consequences, point the reader to remarks that are most appropriate.
- Present a background, such as by describing the question that was addressed by creation an exacting study.
- Explain results of control experiments and comprise remarks that are not accessible in a prescribed figure or table, if appropriate.
- Examine your data, then prepare the analyzed (transformed) data in the form of a figure (graph), table, or in manuscript form.

What to stay away from

- Do not discuss or infer your outcome, report surroundings information, or try to explain anything.
- Not at all, take in raw data or intermediate calculations in a research manuscript.
- Do not present the similar data more than once.
- Manuscript should complement any figures or tables, not duplicate the identical information.
- Never confuse figures with tables - there is a difference.

Approach

- As forever, use past tense when you submit to your results, and put the whole thing in a reasonable order.
- Put figures and tables, appropriately numbered, in order at the end of the report
- If you desire, you may place your figures and tables properly within the text of your results part.

Figures and tables

- If you put figures and tables at the end of the details, make certain that they are visibly distinguished from any attach appendix materials, such as raw facts
- Despite of position, each figure must be numbered one after the other and complete with subtitle
- In spite of position, each table must be titled, numbered one after the other and complete with heading
- All figure and table must be adequately complete that it could situate on its own, divide from text

Discussion:

The Discussion is expected the trickiest segment to write and describe. A lot of papers submitted for journal are discarded based on problems with the Discussion. There is no head of state for how long a argument should be. Position your understanding of the outcome visibly to lead the reviewer through your conclusions, and then finish the paper with a summing up of the implication of the study. The purpose here is to offer an understanding of your results and hold up for all of your conclusions, using facts from your research and generally accepted information, if suitable. The implication of result should be visibly described. Infer your data in the conversation in suitable depth. This means that when you clarify an observable fact you must explain mechanisms that may account for the observation. If your results vary from your prospect, make clear why that may have happened. If your results agree, then explain the theory that the proof supported. It is never suitable to just state that the data approved with prospect, and let it drop at that.

- Make a decision if each premise is supported, discarded, or if you cannot make a conclusion with assurance. Do not just dismiss a study or part of a study as "uncertain."
- Research papers are not acknowledged if the work is imperfect. Draw what conclusions you can based upon the results that you have, and take care of the study as a finished work
- You may propose future guidelines, such as how the experiment might be personalized to accomplish a new idea.
- Give details all of your remarks as much as possible, focus on mechanisms.
- Make a decision if the tentative design sufficiently addressed the theory, and whether or not it was correctly restricted.
- Try to present substitute explanations if sensible alternatives be present.
- One research will not counter an overall question, so maintain the large picture in mind, where do you go next? The best studies unlock new avenues of study. What questions remain?
- Recommendations for detailed papers will offer supplementary suggestions.

Approach:

- When you refer to information, differentiate data generated by your own studies from available information
- Submit to work done by specific persons (including you) in past tense.
- Submit to generally acknowledged facts and main beliefs in present tense.

Please carefully note down following rules and regulation before submitting your Research Paper to Global Journals Inc. (US):

Segment Draft and Final Research Paper: You have to strictly follow the template of research paper. If it is not done your paper may get rejected.

- The **major constraint** is that you must independently make all content, tables, graphs, and facts that are offered in the paper. You must write each part of the paper wholly on your own. The Peer-reviewers need to identify your own perceptive of the concepts in your own terms. NEVER extract straight from any foundation, and never rephrase someone else's analysis.

- Do not give permission to anyone else to "PROOFREAD" your manuscript.

- Methods to avoid Plagiarism is applied by us on every paper, if found guilty, you will be blacklisted by all of our collaborated research groups, your institution will be informed for this and strict legal actions will be taken immediately.)
- To guard yourself and others from possible illegal use please do not permit anyone right to use to your paper and files.

Criterion for Grading a Research Paper (Compilation) by Global Journals Inc. (US)

Please note that following table is only a Grading of "Paper Compilation" and not on "Performed/Stated Research" whose grading solely depends on Individual Assigned Peer Reviewer and Editorial Board Member. These can be available only on request and after decision of Paper. This report will be the property of Global Journals Inc. (US).

Topics	Grades		
	A-B	**C-D**	**E-F**
Abstract	Clear and concise with appropriate content, Correct format. 200 words or below	Unclear summary and no specific data, Incorrect form Above 200 words	No specific data with ambiguous information Above 250 words
Introduction	Containing all background details with clear goal and appropriate details, flow specification, no grammar and spelling mistake, well organized sentence and paragraph, reference cited	Unclear and confusing data, appropriate format, grammar and spelling errors with unorganized matter	Out of place depth and content, hazy format
Methods and Procedures	Clear and to the point with well arranged paragraph, precision and accuracy of facts and figures, well organized subheads	Difficult to comprehend with embarrassed text, too much explanation but completed	Incorrect and unorganized structure with hazy meaning
Result	Well organized, Clear and specific, Correct units with precision, correct data, well structuring of paragraph, no grammar and spelling mistake	Complete and embarrassed text, difficult to comprehend	Irregular format with wrong facts and figures
Discussion	Well organized, meaningful specification, sound conclusion, logical and concise explanation, highly structured paragraph reference cited	Wordy, unclear conclusion, spurious	Conclusion is not cited, unorganized, difficult to comprehend
References	Complete and correct format, well organized	Beside the point, Incomplete	Wrong format and structuring
