On a General Class of Multiple Eulerian Integrals with Multivariable I-Functions

By Frederic Ayant

Abstract- Recently, Raina and Srivastava and Srivastava and Hussain have provided closed-form expressions for a number of a Eulerian integral involving multivariable H-functions. Motivated by these recent works, we aim at evaluating a general class of multiple Eulerian integrals concerning the product of two multivariable I-functions defined by Prathima et al. [6], a class of multivariable polynomials and the spheroidal function. These integrals will serve as a capital formula from which one can deduce numerous integrals.

Keywords: multivariable I-function, multiple eulerian integrals, class of polynomials, spheroidal functions, I-function of two variables, I-function of one variable.

GJSFR-F Classification: MSC 2010: 05C4
On a General Class of Multiple Eulerian Integrals with Multivariable I-Functions

Frederic Ayant

Abstract: Recently, Raina and Srivastava and Srivastava and Hussain have provided closed-form expressions for a number of a Eulerian integral involving multivariable H-functions. Motivated by these recent works, we aim at evaluating a general class of multiple Eulerian integrals concerning the product of two multivariable I-functions defined by Prathima et al. [6], a class of multivariable polynomials and the spheroidal function. These integrals will serve as a capital formula from which one can deduce numerous integrals.

Keywords: multivariable I-function, multiple eulerian integrals, class of polynomials, spheroidal functions, I-function of two variables, I-function of one variable.

1. Introduction and Prerequisites

The well-known Eulerian Beta integral [5]

\[ \int_a^b (z-a)^{\alpha-1}(b-t)^{\beta-1} dt = (b-a)^{\alpha+\beta-1} B(\alpha, \beta) (\text{Re}(\alpha) > 0, \text{Re}(\beta) > 0, b > a) \]  

(1.1)

is a basic result of evaluation of numerous other potentially useful integrals involving various special functions and polynomials. The mathematicians Raina and Srivastava [7], Saigo and Saxena [9], Srivastava and Hussain [14], Srivastava and Garg [13] et cetera have established a number of Eulerian integrals involving the various general class of polynomials, Meijer’s G-function and Fox’s H-function of one and more variables with general arguments. Recently, several Author study some multiple Eulerian integrals, see Bhargava [2], Goyal and Mathur [4] and others. The aim of this paper is to obtain general multiple Eulerian integrals of the product of two multivariable I-functions defined by Prathima et al [7], a general class of multivariable polynomials [12] and the spheroidal functions.

The spheroidal function \( \psi_{\alpha n'}(c, \eta) \) of general order \( \alpha > -1 \) can be expanded as ([10], [18]).

\[ \psi_{\alpha n'}(c, \eta) = \sqrt{\frac{2\pi}{V_{\alpha n'}(c)}} \sum_{k=0, \text{or} 1}^{\infty} a_k(c|\alpha n'') (cn)^{-\alpha - \frac{1}{2}} J_{k+\alpha + \frac{1}{2}} (cn) \]  

(1.2)

Which represents the expression uniformly on \((\infty, \infty)\), where the coefficients \( a_k(c|\alpha n'') \) satisfy the recursion formula and the asterisk over the summation sign indicate that the sum is taken over only even or odd values of according as \( n'' \) is even or odd. As \( c \to 0, a_k(c|\alpha n'') \to 0, k \neq n'' \)

The class of multivariable polynomials defined by Srivastava [12], is given in the following manner:

Author: Teacher in High School, France. e-mail: frederic@gmail.com
where $m_1, \ldots, m_v$ are arbitrary positive integers and the coefficients $A[N_1, K_1; \ldots; N_v, K_v]$ are arbitrary real or complex constants.

We shall note

$$a'_v = \frac{(-N_1)_{m_1} K_1 \cdots (-N_v)_{m_v} K_v}{K_v!} A[N_1, K_1; \ldots; N_v, K_v]$$

The I-function of several variables is a generalization of the multivariable H-function studied by Srivastava et Panda [16,17]. The multiple Mellin–Barnes integrals occurring in this paper will be referred to as the multivariables $I$–function of $r$-variables throughout our present study and will refer and represented as follows:

$$I(z_1, \ldots, z_r) = \prod_{p, q; p+q \neq 1, 1} \psi(s_1, \ldots, s_r) \prod_{k=1}^{r} \theta_k(s_k) \int_{L_1}^{z_1} \cdots \int_{L_r}^{z_r} \frac{d s_1 \cdots d s_r}{(2\pi i)^r}$$

Where $\psi(s_1, \ldots, s_r), \theta_i(s_i), i = 1, \ldots, r$ are given by:

$$\psi(s_1, \ldots, s_r) = \prod_{j=1}^{r} \Gamma^A_j \left( 1 - a_j + \sum_{s=1}^{r} \alpha_j^{(s)} s_j \right)$$

$$\theta_i(s_i) = \frac{\prod_{j=1}^{r} \Gamma_{C_j}^{(i)} \left( 1 - c_j^{(i)} + \gamma_j^{(i)} s_i \right) \prod_{j=1}^{q_i} \Gamma^B_j \left( 1 - b_j + \sum_{s=1}^{q_i} \delta_j^{(s)} s_i \right)}{\prod_{j=1}^{m_i} \Gamma_{c_j}^{(i)} \left( 1 - c_j^{(i)} - \gamma_j^{(i)} s_i \right) \prod_{j=1}^{m_i} \Gamma^B_j \left( 1 - d_j^{(i)} - \delta_j^{(i)} s_i \right)}$$

For more details, see Prathima et al. [6]. Following the result of Braaksma [3] the I-function of $r$ variables is analytic if:

$$U_i = \sum_{j=1}^{r} A_j \alpha_j^{(i)} - \sum_{j=1}^{q_i} B_j \delta_j^{(i)} + \sum_{j=1}^{p_i} C_j^{(i)} \gamma_j^{(i)} - \sum_{j=1}^{q_i} D_j^{(i)} \gamma_j^{(i)} \leq 0; i = 1, \ldots, r$$

The integral (1.4) converges absolutely if

$$|\arg(z_k)| < \frac{1}{2} \Delta_k \pi, k = 1, \ldots, r$$

where

$$\Delta_k = \sum_{j=1}^{r} A_j \alpha_j^{(k)} - \sum_{j=1}^{q_i} B_j \delta_j^{(k)} + \sum_{j=1}^{q_i} D_j^{(k)} \delta_j^{(k)} + \sum_{j=1}^{p_i} C_j^{(k)} \gamma_j^{(k)} - \sum_{j=1}^{q_i} C_j^{(k)} \gamma_j^{(k)} > 0$$

and if all the poles of (1.6) are simple, then the integral (1.4) can be evaluated with the help of the residue theorem to give

$$I(z_1, \cdots, z_r) = \sum_{G_k=1}^{m_k} \sum_{g_k=0}^{\infty} \phi \frac{\Pi_{k=1}^{r} \phi_k z_k^{\eta \alpha_k g_k} (-)^{\sum_{j=1}^{r} g_j}}{\Pi_{k=1}^{r} \delta^{(k)}_{G_k} \Pi_{k=1}^{r} g_k!} \tag{1.7}$$

Where $\phi$ and $\phi_i$ are defined by

$$\phi = \frac{\Pi_{j=1}^{n} \Gamma(A_j) \left(1 - a_j + \sum_{i=1}^{r} \alpha_j^{(i)} S_k\right)}{\Pi_{j=n+1}^{p} \Gamma(A_j) \left(a_j - \sum_{i=1}^{r} \alpha_j^{(i)} S_k\right) \Pi_{j=1}^{q} \Gamma(B_j) \left(1 - b_j + \sum_{i=1}^{r} \beta_j^{(i)} S_k\right)}$$

and

$$\phi_i = \frac{\Pi_{j=1}^{n} \Gamma(C_j^{(i)}) \left(1 - c_j^{(i)} + \gamma_j^{(i)} S_k\right)}{\Pi_{j=n+1}^{p} \Gamma(C_j^{(i)}) \left(c_j^{(i)} - \gamma_j^{(i)} S_k\right) \Pi_{j=m+1}^{q} \Gamma(D_j^{(i)}) \left(1 - d_j^{(i)} + \delta_j^{(i)} S_k\right)}, \quad i = 1, \cdots, r$$

where

$$S_k = \eta G_k g_k = \frac{d_k^{(k)}}{\delta_k^{(k)}} \text{ for } k = 1, \cdots, r$$

which is valid under the following conditions: $c_k^{(i)} [p_k^{(i)} + p_k^{(i)}] \neq c_k^{(i)} [p_k^{(i)} + g_k^{(i)}]$

Consider the second multivariable I-function.

$$I(z'_1, \cdots, z'_s) = \frac{1}{(2\pi i)^s} \int_{L_1} \cdots \int_{L_s} \zeta(t_1, \cdots, t_s) \prod_{k=1}^{s} \phi_k(t_k) z_k^{t_k} dt_1 \cdots dt_s \tag{1.8}$$

where $\zeta(t_1, \cdots, t_s), \phi_i(s_i), i = 1, \cdots, s$ are given by:

$$\zeta(t_1, \cdots, t_s) = \frac{\Pi_{j=1}^{n} \Gamma(A_j) \left(1 - a_j + \sum_{i=1}^{s} \alpha_j^{(i)} t_j\right)}{\Pi_{j=n+1}^{p} \Gamma(A_j) \left(a_j - \sum_{i=1}^{s} \alpha_j^{(i)} t_j\right) \Pi_{j=1}^{q} \Gamma(B_j) \left(1 - b_j + \sum_{i=1}^{s} \beta_j^{(i)} t_j\right)}$$

$$\phi_i(s_i) = \frac{\Pi_{j=1}^{n} \Gamma(C_j^{(i)}) \left(1 - c_j^{(i)} + \gamma_j^{(i)} t_i\right) \Pi_{j=n+1}^{p} \Gamma(C_j^{(i)}) \left(c_j^{(i)} - \gamma_j^{(i)} t_i\right) \Pi_{j=m+1}^{q} \Gamma(D_j^{(i)}) \left(1 - d_j^{(i)} + \delta_j^{(i)} t_i\right)}{\Pi_{j=n+1}^{p} \Gamma(C_j^{(i)}) \left(c_j^{(i)} - \gamma_j^{(i)} t_i\right) \Pi_{j=m+1}^{q} \Gamma(D_j^{(i)}) \left(1 - d_j^{(i)} + \delta_j^{(i)} t_i\right)}$$

For more details, see Prathima et al. [6].

Following the result of Braaksma [3], the I-function of $r$ variables is analytic if:
\[ U'_i = \sum_{j=1}^{q'_i} A'_j \alpha'_j(i) - \sum_{j=1}^{q'_j} B'_j \beta'_j(i) + \sum_{j=1}^{p'_j} C'_j \gamma'_j(i) - \sum_{j=1}^{q'_j} D'_j \delta'_j(i) \leq 0; i = 1, \ldots, s \]  

The integral (1.13) converges absolutely if

\[ |\arg(z'_k)| < \frac{1}{2} \Delta'_k \pi; k = 1, \ldots, s. \]

Where

\[ \Delta'_k = - \sum_{j=m'_k+1}^{q'_k} A'_j \alpha'_j(k) - \sum_{j=m'_k+1}^{q'_k} B'_j \beta'_j(k) + \sum_{j=m'_k+1}^{n'_k} D'_j \delta'_j(k) - \sum_{j=n'_k+1}^{q'_k} C'_j \gamma'_j(k) - \sum_{j=n'_k+1}^{q'_k} C'_j \gamma'_j(k) > 0 \]

### II. Integral Representation of Generalized Hypergeometric Function

The following generalized hypergeometric function regarding multiple integrals contour is also required [15, page 39 eq. 30]

\[
\frac{\prod_{j=1}^{P} \Gamma(A_j)}{\prod_{j=1}^{Q} \Gamma(B_j)} \binom{P}{Q} \left[ (A_P); (B_Q); -(x_1 + \cdots + x_r) \right]
\]

\[
= \frac{1}{(2\pi i)^r} \int_{L_1} \cdots \int_{L_r} \frac{\prod_{j=1}^{P} \Gamma(A_j + s_1 + \cdots + s_r)}{\prod_{j=1}^{Q} \Gamma(B_j + s_1 + \cdots + s_r)} \Gamma(-s_1) \cdots \Gamma(-s_r) x_1^{s_1} \cdots x_r^{s_r} ds_1 \cdots ds_r
\]

where the contours are of Barnes type with indentations, if necessary, to ensure that the poles of \( \Gamma(A_j + s_1 + \cdots + s_r) \) are separated from those of \( \Gamma(-s_j), j = 1, \ldots, r \). The above result (2.1) is easily established by an appeal to the calculus of residues by calculating the residues at the poles of \( \Gamma(-s_j), j = 1, \ldots, r \)

The equivalent form of Eulerian beta integral is given by (1.1):

### III. Main Integral

We shall note:

\[ X = m'_1, m'_2; \cdots; m'_r, n'_1, 1, 0; \cdots; 1, 0; 1, 0; \cdots; 1, 0 \]

\[ Y = p'_1, q'_1; \cdots; p'_r, q'_r; 0, 1; \cdots; 0, 1, 0; 1, 0; \cdots; 1, 0 \]

\[ A = [1 + \sigma_1^{(1)} - \sum_{k=1}^{v} K_{k, s} \rho^{(1, k)}(s) - \sum_{k=1}^{r} \eta_{G_k, s} \rho^{(1, s)}(s) - \theta^{(1)}(2R + k'), \rho^{(2)}(T, s), r^{(1)}(1, 0, \cdots, 0; 0)_{1,s}] \]

\[ \cdots, [1 + \sigma_1^{(T)} - \sum_{k=1}^{v} K_{k, s} \rho^{(T, k)}(s) - \sum_{k=1}^{r} \eta_{G_k, s} \rho^{(T, s)}(s) - \theta^{(T)}(2R + k'), \rho^{(T, r)}(T, s), r^{(T)}(1, 0, \cdots, 0; 0)_{1,s}] \]

\[ [1 - A; 0, \cdots, 0, 1, \cdots, 1, 0, \cdots, 0; 0]_{1,s} \]

\[ [1 - \alpha - \sum_{k=1}^{v} K_{k, s} \rho^{(k)}(s) - \sum_{k=1}^{r} \eta_{G_k, s} \rho^{(k)}(s) - (2R + k') \zeta^{(1)}(s), \cdots, \delta^{(1)}(s), \mu^{(1)}(s), \cdots, \mu^{(T)}(s), r^{(1)}(1, 0, \cdots, 0; 0)_{1,s}] \]
We have the following multiple Eulerian integrals, and we obtain the I-function of variables.

Theorem

On a General Class of Multiple Eulerian Integrals with Multivariable I-Functions

\[
[1 - \beta_i - \sum_{k'=1}^v K_{k'} \eta_i^{(k')} - \sum_{k=1}^r \eta_{G_k \cdot s_k} \eta_i^{(k)} - (2R + k') \lambda_i \eta_i^{(1)} \cdots \eta_i^{(s)} \theta_i^{(1)} \cdots \theta_i^{(l)}]_{1,s}
\]

\[
A = (\alpha_i^{(1)}, \cdots, \alpha_i^{(s)}, 0, \cdots, 0, 0, \cdots, 0; A_j)_{1,q'} : (c_j^{(1)}, \gamma_j^{(1)}; C_j^{(1)})_{1,q'} \cdots (c_j^{(r)}, \gamma_j^{(r)}; C_j^{(r)})_{1,q'}
\]

\[
(1, 0, 1) \cdots (1, 0, 1); (1, 0, 1); \cdots; (1, 0, 1)
\]

\[
B = [1 + \sigma_i^{(1)} - \sum_{k'=1}^v K_{k'} \rho_i^{(1, k')} - \sum_{k=1}^r \eta_{G_k \cdot s_k} \rho_i^{(1, k)} - \theta_i^{(1)} (2R + k') \rho_i^{(1, 1)} \cdots \rho_i^{(1, s)} \gamma_i^{(1)} \cdots \gamma_i^{(l)}]_{1,s}
\]

\[
\cdots, [1 + \sigma_i^{(T)} - \sum_{k'=1}^v K_{k'} \rho_i^{(T, k')} - \sum_{k=1}^r \eta_{G_k \cdot s_k} \rho_i^{(T, k)} - \theta_i^{(T)} (2R + k') \rho_i^{(T, 1)} \cdots \rho_i^{(T, s)} \gamma_i^{(T)} \cdots \gamma_i^{(l)}]_{1,s}
\]

\[

\]

\[ \psi_{n,m} \left[ c^n, \prod_{j=1}^T \left( U_i^{(j)} x_i + V_i^{(j)} \right)^{\phi_i^{(j)}} \right] \]

\[ m = 1, \ldots, s
\]
\[ W_k = \prod_{i=1}^{t} \left[ (v_i - u_i)^{\mu_i(k)} + \delta_i^{(k)} \right] \prod_{j=1}^{W} \left( u_i U_i^{(j)} + V_i^{(j)} \right)^{-\tau_i^{(j,k)}} \prod_{j=W+1}^{T} \left( u_i U_i^{(j)} + V_i^{(j)} \right)^{-\tau_i^{(j,k)}}, k = 1, \ldots, l \]

\[ G_j = \prod_{i=1}^{t} \left[ \frac{(v_i - u_i) U_i^{(j)}}{u_i U_i^{(j)} + V_i^{(j)}} \right], j = 1, \ldots, W \]

\[ G_j = -\prod_{i=1}^{t} \left[ \frac{(v_i - u_i) U_i^{(j)}}{u_i U_i^{(j)} + V_i^{(j)}} \right], j = W + 1, \ldots, T \]

\[ \sum_{G_{k=1} G_{k}=0}^{m} \sum_{G_{r=1} G_{r}=0}^{n} = \sum_{G_{1,\ldots,G_{r}=1} G_{1,\ldots,G_{r}=0}}^{m} \sum_{G_{s=1} G_{s}=0}^{l} \]

Provided that:

(A) \( W \in [0, T], u_i, v_i \in \mathbb{R}; i = 1, \ldots, t \)

(B) \( \min \{ \delta_i^{(k)}, \eta_i^{(k)}, \delta_i^{(h)}, \eta_i^{(h)}, \delta_i^{(v)}, \eta_i^{(v)}, \xi_i, \eta_i \} \geq 0; g = 1, \ldots, r; i = 1, \ldots, t; h = 1, \ldots, s; k = 1, \ldots, v \)

(C) \( \sigma_i^{(j)} \in \mathbb{R}, U_i^{(j)}, V_i^{(j)} \in \mathbb{C}; z_i, z_j, z_i^{(j)}, z_j^{(j)}, \eta_i, G_j \in \mathbb{C}; i = 1, \ldots, t; j = 1, \ldots, T; j' = 1, \ldots, r; j' = 1, \ldots, s; k' = 1, \ldots, v, k = 1, \ldots, l \)

(D) \( \max \left[ \frac{(v_i - u_i) U_i^{(j)}}{u_i U_i^{(j)} + V_i^{(j)}} \right] < 1, i = 1, \ldots, s; j = 1, \ldots, W \)

(E) \( \arg \left( \prod_{j=1}^{T} (U_i^{(j)} x_i + V_i^{(j)}) \right) \left( \frac{1}{2} \Delta_k \pi, k = 1, \ldots, r, \right. \) where

\[ \Delta_k = -\sum_{j=n+1}^{p} A_j \alpha_j^{(k)} - \sum_{j=1}^{q} B_j \beta_j^{(k)} + \sum_{j=1}^{m_k} \delta_j^{(k)} - \sum_{j=m_k+1}^{q_k} D_j^{(k)} \gamma_j^{(k)} - \sum_{j=n_k+1}^{q_k} C_j^{(k)} \gamma_j^{(k)} - \sum_{j=n_k+1}^{q_k} C_j^{(k)} \gamma_j^{(k)} - \sum_{j=1}^{Q} C_j^{(k)} \gamma_j^{(k)} \]

- \delta_i^{(k)} - \eta_i^{(k)} - \sum_{j=1}^{T} \rho_i^{(j,k)} > 0 \]

\[ \arg \left( \prod_{j=1}^{T} (U_i^{(j)} x_i + V_i^{(j)}) \right) \left( \frac{1}{2} \Delta_k' \pi, k = 1, \ldots, s, \right. \) where

\[ \Delta_k' = -\sum_{j=n+1}^{p'} A_j' \alpha_j^{(k)} - \sum_{j=1}^{q'} B_j' \beta_j^{(k)} + \sum_{j=1}^{m_k'} D_j^{(k)} \delta_j^{(k)} - \sum_{j=m_k'+1}^{q_k'} D_j^{(k)} \delta_j^{(k)} - \sum_{j=n_k'+1}^{q_k'} C_j^{(k)} \gamma_j^{(k)} - \sum_{j=n_k'+1}^{q_k'} C_j^{(k)} \gamma_j^{(k)} - \sum_{j=1}^{Q} C_j^{(k)} \gamma_j^{(k)} \]

- \delta_i^{(k)} - \eta_i^{(k)} - \sum_{j=1}^{T} \rho_i^{(j,k)} > 0 \]
To establish the formula (4.7), we first express the spheroidal function, the class of multivariable polynomials \( S_{\frac{m_1, \ldots, m_r}{N_1, \ldots, N_r}} \), and the multivariable I-function \( I(z_1, \ldots, z_r) \) in series with the help of (1.2), (1.3) and (1.7) respectively, use integral contour representation with the help of (1.8) for the multivariable I-function occurring in its left-hand side and use the integral contour representation with the help of (2.1) for the Generalized hypergeometric function \( pF_q(.) \). Changing the order of integration and summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process). Now we write:

\[
\prod_{j=1}^{T} (U_i^{(j)} x_i + V_i^{(j)}) K_i^{(j)} = \prod_{j=1}^{W} (U_i^{(j)} x_i + V_i^{(j)}) K_i^{(j)} \prod_{j=W+1}^{T} (U_i^{(j)} x_i + V_i^{(j)}) K_i^{(j)} \tag{3.2}
\]

where \( K_i^{(j)} = v_i^{(j)} - \theta_i^{(j)} (2R + k^0) - \sum_{l=1}^{r} \rho_i^{(j,l)} \eta G_l, q_r - \sum_{l=1}^{s} \rho_i^{(j,l)} \psi_l - \sum_{l=1}^{v} \rho_i^{(j,v)} K_l \) where \( i = 1, \ldots, t; j = 1, \ldots, T \)

and express the factors occurring in R.H.S. Of (3.1) in terms of following Mellin-Barnes integrals contour, we obtain:

\[
\prod_{j=1}^{W} (U_i^{(j)} x_i + V_i^{(j)}) K_i^{(j)} = \prod_{j=1}^{W} \left[ \frac{(U_i^{(j)}(x_i - u_i) + V_i^{(j)} K_i^{(j)})}{\Gamma(-K_i^{(j)})} \right] \frac{1}{(2\pi \omega)^W} \int_{L_0^W} \cdots \int_{L_T^W} \prod_{j=1}^{W} \Gamma(-\zeta_j^i) \Gamma(-K_i^{(j)} + \zeta_j^i) \tag{3.3}
\]

\[
\prod_{j=W+1}^{T} (U_i^{(j)} x_i + V_i^{(j)}) K_i^{(j)} = \prod_{j=W+1}^{T} \left[ \frac{(U_i^{(j)}(v_i - x_i) + V_i^{(j)} K_i^{(j)})}{\Gamma(-K_i^{(j)})} \right] \frac{1}{(2\pi \omega)^{T-W}} \int_{L_{W+1}^T} \cdots \int_{L_{T+1}^T} \prod_{j=W+1}^{T} \Gamma(-\zeta_j^i) \Gamma(-K_i^{(j)} + \zeta_j^i) \tag{3.4}
\]

Proof

To establish the formula (4.7), we first express the spheroidal function, the class of multivariable polynomials \( S_{\frac{m_1, \ldots, m_r}{N_1, \ldots, N_r}} \) and the multivariable I-function \( I(z_1, \ldots, z_r) \) in series with the help of (1.2), (1.3) and (1.7) respectively, use integral contour representation with the help of (1.8) for the multivariable I-function occurring in its left-hand side and use the integral contour representation with the help of (2.1) for the Generalized hypergeometric function \( pF_q(.) \). Changing the order of integration and summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process). Now we write:
We apply the Fubini's theorem for multiple integrals. Finally evaluating the innermost \( x \)-integral with the help of (1.1) and reinterpreting the multiple Mellin-Barnes integrals contour in terms of multivariable I-function of \((r+t+T)\) variables, we obtain the formula (3.1).

IV. Particular Cases

a) I-functions of two variables

Corollary 1

If \( r = s = 2 \), then the multivariable I-functions reduce to I-functions of two variables defined by Rathie et al. [9]. We have.

\[
\int_{u_1}^{v_1} \cdots \int_{u_t}^{v_t} \prod_{i=1}^{t} \left[ \frac{(x_i - u_i)^{\alpha_i-1}(v_i - x_i)^{\beta_i-1}}{\prod_{j=1}^{T} (U_i^{(j)}x_i + V_i^{(j)})^{\gamma_i^{(j)}}} \right]
\]

\[
I \left( \sum_{N_1 \cdots N_T} \left( \prod_{i=1}^{t} \left[ \frac{(x_i - u_i)^{\alpha_i^{(1)}-1}(v_i - x_i)^{\beta_i^{(1)}-1}}{\prod_{j=1}^{T} (U_i^{(j)}x_i + V_i^{(j)})^{\gamma_i^{(j,1)}}} \right] \right) \right)
\]

\[
P \left( \sum_{N_1 \cdots N_T} \left( \prod_{i=1}^{t} \left[ \frac{(x_i - u_i)^{\alpha_i^{(2)}-1}(v_i - x_i)^{\beta_i^{(2)}-1}}{\prod_{j=1}^{T} (U_i^{(j)}x_i + V_i^{(j)})^{\gamma_i^{(j,2)}}} \right] \right) \right)
\]

\[
\psi_{\alpha_0^{(r)}} \prod_{j=1}^{T} \left[ \frac{(x_i - u_i)^{\gamma_i^{(r)}}(v_i - x_i)^{\lambda_i}}{\prod_{j=1}^{T} (U_i^{(j)}x_i + V_i^{(j)})^{\theta_i^{(j)}}} \right]
\]

\[
pFq \left[ \left( A_P; \frac{B_Q}{B}; - \sum_{k=1}^{l} g_k \prod_{i=1}^{t} \left[ \frac{(x_i - u_i)^{\alpha_i^{(k)}-1}(v_i - x_i)^{\beta_i^{(k)}-1}}{\prod_{j=1}^{T} (U_i^{(j)}x_i + V_i^{(j)})^{\gamma_i^{(j,k)}}} \right] \right) \right] \text{d}x_1 \cdots \text{d}x_s
\]

\[
= \frac{\prod_{j=1}^{Q} \Gamma(B_j)}{\prod_{j=1}^{P} \Gamma(A_j)} \prod_{j=1}^{W} \left( \frac{u_i U_i^{(j)} + V_i^{(j)}}{x_i + V_i^{(j)}} \right)^{\gamma_i^{(j)}} \prod_{j=W+1}^{T} \left( \frac{u_i U_i^{(j)} + V_i^{(j)}}{x_i + V_i^{(j)}} \right)^{\theta_i^{(j)}}
\]

\[
\sum_{k=0}^{\infty} \sum_{R=1}^{\infty} \frac{\phi_2}{\prod_{k=1}^{T} \delta_{N_k}^{(k)} a_k^{R} \left( \frac{C}{\alpha} \right)^{R} \Gamma(\alpha + \frac{3}{2})}
\]
The validity conditions are the same that (3.1) with \( r = s = 2 \). The quantities \( \phi_2, \phi_3, V_2, W_2, A_2, B_2, A_2, B_2 \) are equal to \( \phi, \phi_k, V, W, A, B, A, B \) respectively for \( r = s = 2 \).

**b) I-function of one variable**

**Corollary 2**

If \( r = s = 1 \), the multivariable I-functions reduce to I-functions of one variable defined by Rathie [8]. We have

\[
\int_{u_1}^{v_1} \cdots \int_{u_t}^{v_t} \prod_{i=1}^{t} \left[ (x_i - u_i)^{\alpha_i - 1} (v_i - x_i)^{\beta_i - 1} \prod_{j=1}^{T} (u_{i}^{(j)} x_i + V_{i}^{(j)})^\sigma_i \right] \]

\[
I \left( z^{\prod_{i=1}^{t}} \left[ \frac{(x_i - u_i)^{\epsilon_i} (v_i - x_i)^{\eta_i}}{\prod_{j=1}^{T} (u_{i}^{(j)} x_i + V_{i}^{(j)})^{\rho_i}} \right] \right) I \left( z^{\prod_{i=1}^{t}} \left[ \frac{(x_i - u_i)^{\epsilon_i} (v_i - x_i)^{\eta_i}}{\prod_{j=1}^{T} (u_{i}^{(j)} x_i + V_{i}^{(j)})^{\rho_i}} \right] \right)
\]

\[
\left( z^{\prod_{i=1}^{t}} \left[ \frac{(x_i - u_i)^{\epsilon_i} (v_i - x_i)^{\eta_i}}{\prod_{j=1}^{T} (u_{i}^{(j)} x_i + V_{i}^{(j)})^{\rho_i}} \right] \right)
\]

\[
\psi_{\alpha\nu\gamma} \left[ \prod_{j=1}^{T} \left[ \frac{(x_i - u_i)^{\delta_i} (v_i - x_i)^{\kappa_i}}{\prod_{j=1}^{T} (u_{i}^{(j)} x_i + V_{i}^{(j)})^{\tau_i}} \right] \right]
\]

\[
_F q \left[ (A_p); (B_q); - \sum_{k=1}^{t} g_k \prod_{i=1}^{t} \left[ \frac{(x_i - u_i)^{\nu_i} (v_i - x_i)^{\mu_i}}{\prod_{j=1}^{T} (u_{i}^{(j)} x_i + V_{i}^{(j)})^{\rho_i}} \right] \right] \right] dx_1 \cdots dx_s
\]

\[
= \frac{\prod_{j=1}^{p} \Gamma(B_j)}{\prod_{j=1}^{p} \Gamma(A_j)} \sum_{j=1}^{T} \left[ (v_i - u_i)^{\alpha_i + \beta_i - 1} \prod_{j=1}^{W} (u_i U_{i}^{(j)} + V_{i}^{(j)})^{\sigma_i} \right] \prod_{j=W+1}^{T} (u_i U_{i}^{(j)} + V_{i}^{(j)})^{\sigma_i}
\]

\[
\sum_{k'=0, \alpha' \geq 1}^{\infty} \sum_{K_1=0}^{N_1} \cdots \sum_{K_t=0}^{N_t} \sum_{G_1=0}^{m_1} \cdots \sum_{G_t=0}^{m_t} \frac{\phi_{\alpha\nu\gamma} \left[ \frac{(-)^{q_1} a_{k}^{(1)} \cdots a_{k}^{(t)} K_1 \cdots K_t}{\Gamma(R + k^{(t)} + \alpha + \frac{3}{2})} \right]}{E_{ij}}
\]

\[
\sum_{k'=0, \alpha' \geq 1}^{\infty} \sum_{K_1=0}^{N_1} \cdots \sum_{K_t=0}^{N_t} \sum_{G_1=0}^{m_1} \cdots \sum_{G_t=0}^{m_t} \frac{\phi_{\alpha\nu\gamma} \left[ \frac{(-)^{q_1} a_{k}^{(1)} \cdots a_{k}^{(t)} K_1 \cdots K_t}{\Gamma(R + k^{(t)} + \alpha + \frac{3}{2})} \right]}{E_{ij}}
\]
The validity conditions are the same that (3.1) with $r = s = 1$. The quantities $\phi_1, V_1, W_1, A_1, B_1, A_1, B_1$ are equal to $\phi_s, V, W, A, B, A, B$ respectively for $r = s = 1$.

**Remark:** By the similar procedure, the results of this document can be extended to the product of any finite number of multivariable I-functions and class of multivariable polynomials defined by Srivastava [12].

**V. Conclusion**

Our main integral formula is unified in nature and possesses manifold generality. It acts a fundamental expression and using various particular cases of the multivariable I-function, the class of multivariable polynomials and a general spheroidal functions, one can obtain a large number of other integrals involving simpler special functions and polynomials of one and several variables.
